**Your Partner for Sealing Technology**

## Your Partner for Sealing Technology

Trelleborg Sealing Solutions is a major international sealing force, uniquely placed to offer dedicated design and development from our market leading product and material portfolio; a one-stop shop providing the best in elastomer, thermoplastic, PTFE and composite technologies for applications in aerospace, industrial, and automotive industries.

With 50-years experience, Trelleborg Sealing Solutions engineers support customers with design, prototyping, production, test and installation using state-of-the-art design tools. An international network of over 70 facilities worldwide includes 30 manufacturing sites, strategically positioned research and development centers, including materials and development laboratories and locations specializing in design and applications.

Developing and formulating materials in-house, we utilize the resource of our material database, including over 2,000 proprietary compounds and a range of unique products.

Trelleborg Sealing Solutions fulfills challenging service requirements, supplying standard parts in volume or a single custom-manufactured component, through our integrated logistical support, which effectively delivers over 40,000 sealing products to customers worldwide.

Facilities are certified to ISO 9001:2000 and ISO/TS 16949:2002. Trelleborg Sealing Solutions is backed by the experiences and resources of one of the world's foremost experts in polymer technology, Trelleborg Group.

**ISO 9001:2000**

**ISO/TS 16949:2002**

The information in this brochure is intended to be for general reference purposes only and is not intended to be a specific recommendation for any individual application. The application limits for pressure, temperature, speed and media given are maximum values determined in laboratory conditions. In application, due to the interaction of operating parameters, maximum values may not be achieved. It is vital therefore, that customers satisfy themselves as to the suitability of product and material for each of their individual applications. Any reliance on information is therefore at the user's own risk. In no event will Trelleborg Sealing Solutions be liable for any loss, damage, claim or expense directly or indirectly arising or resulting from the use of any information provided in this brochure. While every effort is made to ensure the accuracy of information contained herewith, Trelleborg Sealing Solutions cannot warrant the accuracy or completeness of information.

## O-Ring

---

## A General information

### A.1 Description

O-Rings offer the designer an efficient and economical sealing element for a wide range of static or dynamic applications.

Inexpensive production methods and its ease of use have made the O-Ring the most widely used seal.

A wide choice of elastomer materials for both standard and special applications allow the O-Ring to be used to seal practically all liquid and gaseous media.

O-Rings are vulcanised in moulds and are characterised by their circular form with annular cross section. The dimensions of the O-Ring are defined by the inside diameter  $d_1$  and the cross section  $d_2$  (Figure 1).

Cross sections of approx. 0.35 to 40 mm and inside diameters up to 5,000 mm and more are available.

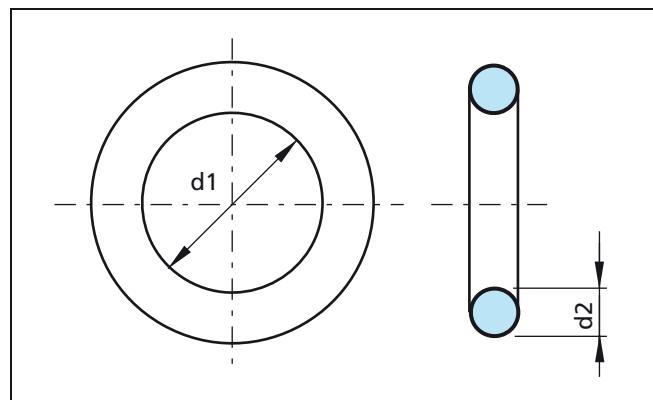

Figure 1 O-Ring dimensioning

### Advantages

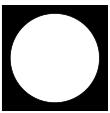

Compared with other sealing elements, the O-Ring has a wide range of advantages:

- Simple, one piece groove design reduces hardware and design costs
- Compact design allows smaller hardware
- Easy, foolproof installation reduces risk
- Applicable to a wide range of sealing problems, static, dynamic, single or double acting
- Wide compound choice for compatibility with most fluids
- Ex stock availability of many sizes worldwide for easy maintenance and repair.

### A.2 Applications

O-Rings are used as sealing elements or as energising elements for hydraulic slipper seals and wipers and thus cover a large number of fields of application. There are no fields of industry where the O-Ring is not used. From an individual seal for repairs or maintenance to a quality assured application in aerospace, automotive or general engineering. The O-Ring is used predominantly for static sealing applications:

- As a radial static seal, e.g. for bushings, covers, pipes, cylinders
  - As an axial static seal, e.g. for flanges, plates, caps.
- O-Rings in dynamic applications are recommended **only for moderate service conditions**. They are limited by the speed and the pressure against which they are to seal:
- For low duty sealing of reciprocating pistons, rods, plungers, etc.
  - For sealing of slowly pivoting, rotating or spiral movements on shafts, spindles, rotary transmission leadthroughs, etc.

## O-Ring

### A.3 Method of operation

O-Rings are double-acting sealing elements. The initial squeeze, which acts in a radial or axial direction depending on the installation, gives the O-Ring its initial sealing capability. These forces are superimposed by the system pressure to create the total sealing force which increases as the system pressure increases (Figure 2).

Under pressure, the O-Ring behaves in a similar way to a fluid with high surface tension. The pressure is transmitted uniformly to all directions.

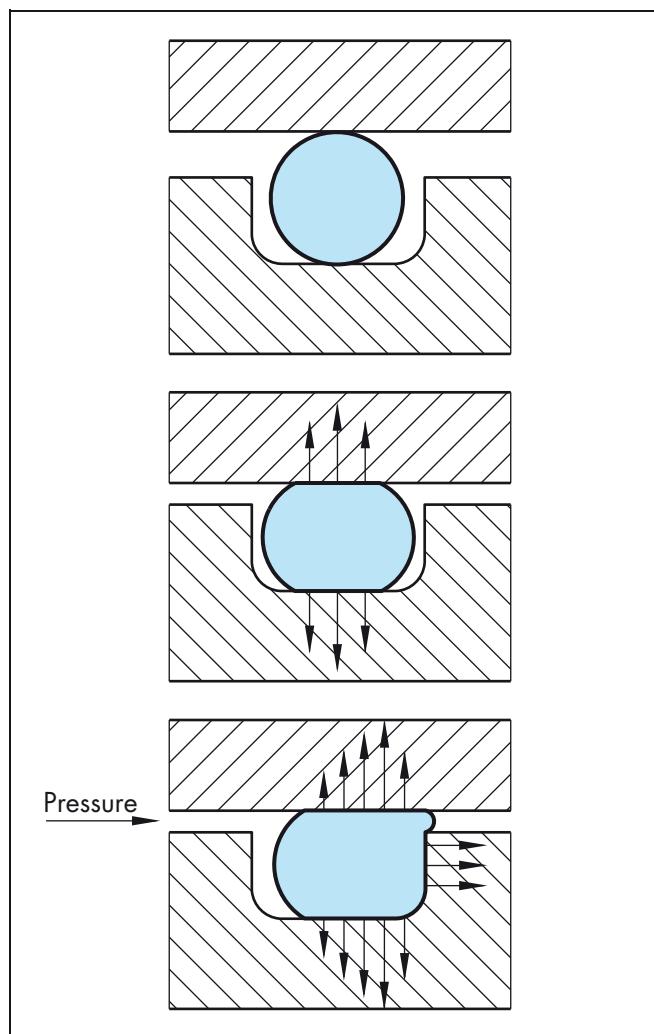

Figure 2 O-Ring sealing forces with and without system pressure

## B Technical information

### B.1 Materials

#### B.1.1 Elastomers

Equipment manufacturers and end users expect sealing systems to operate leak free and to maintain long service life. Reliability is crucial to effective low maintenance cost operations. To find the perfect sealing solution in each individual case both material performance and seal design are critically important. One of the main used material

groups for sealings are the elastomers. They show good properties like elasticity or good chemical compatibility.

The following tables provide a summary of the various elastomer material groups. Trelleborg Sealing Solutions can offer a large number of materials within each group.

If no particular specifications are given for the material, standard NBR (Nitrile Rubber) in 70 Shore A will be supplied (see chapter "B.1.5 Standard materials").

**Table I Elastomers**

## B.1.2 Application parameters of elastomers

Elastomers as all other organic chemicals have limited use. External influences such as various media, oxygen or ozone as well as pressure and temperature will affect the material properties and therefore their sealing capability.

Elastomers will amongst others swell, shrink or harden and develop cracks or even tears. The following information illustrates the different application parameters.

### Elastomer heat resistance / swelling in oil

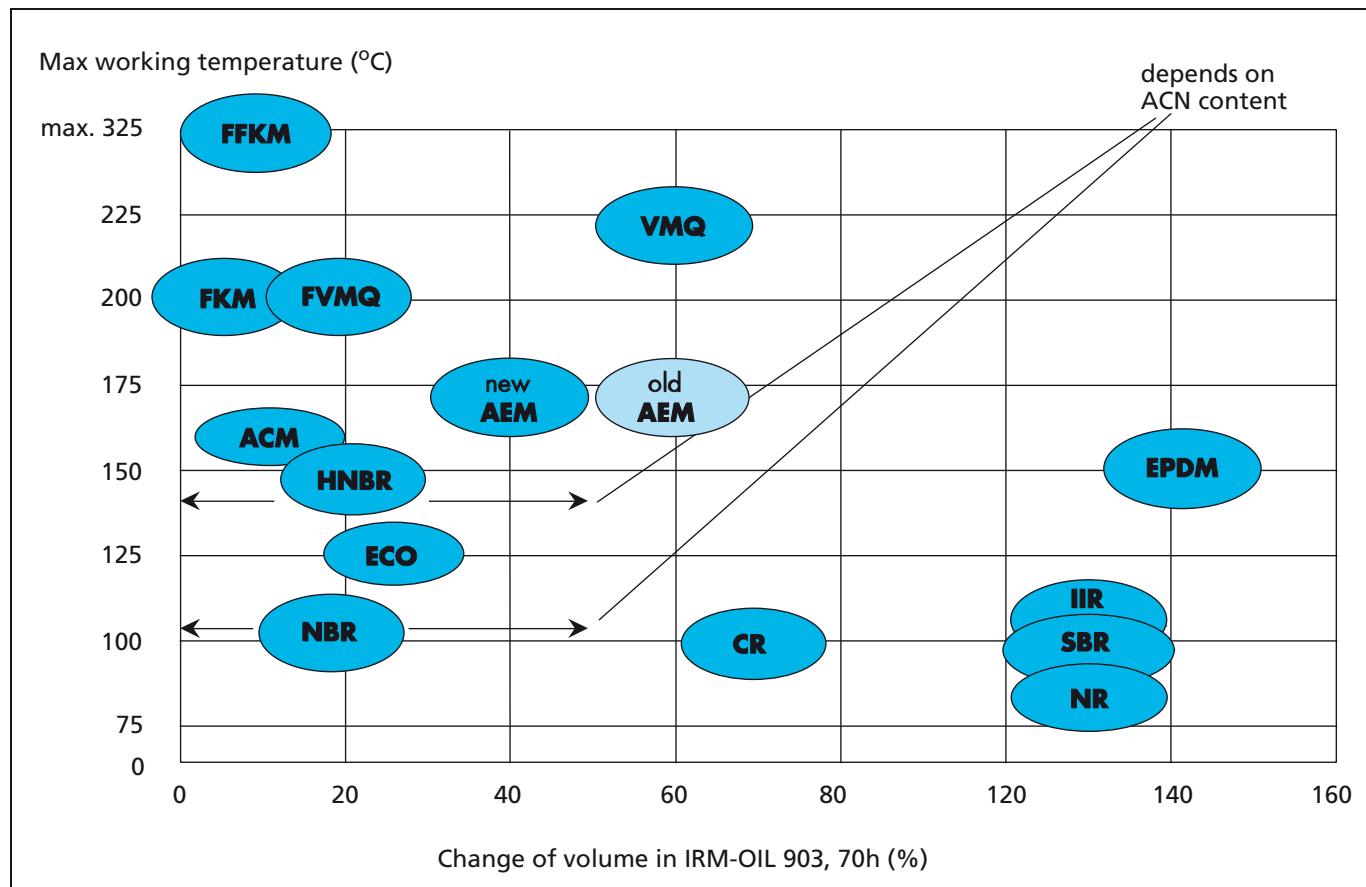

Figure 3 Change of volume in IRM-Oil 903 (old ASTM-Oil No 3)

## Temperature range

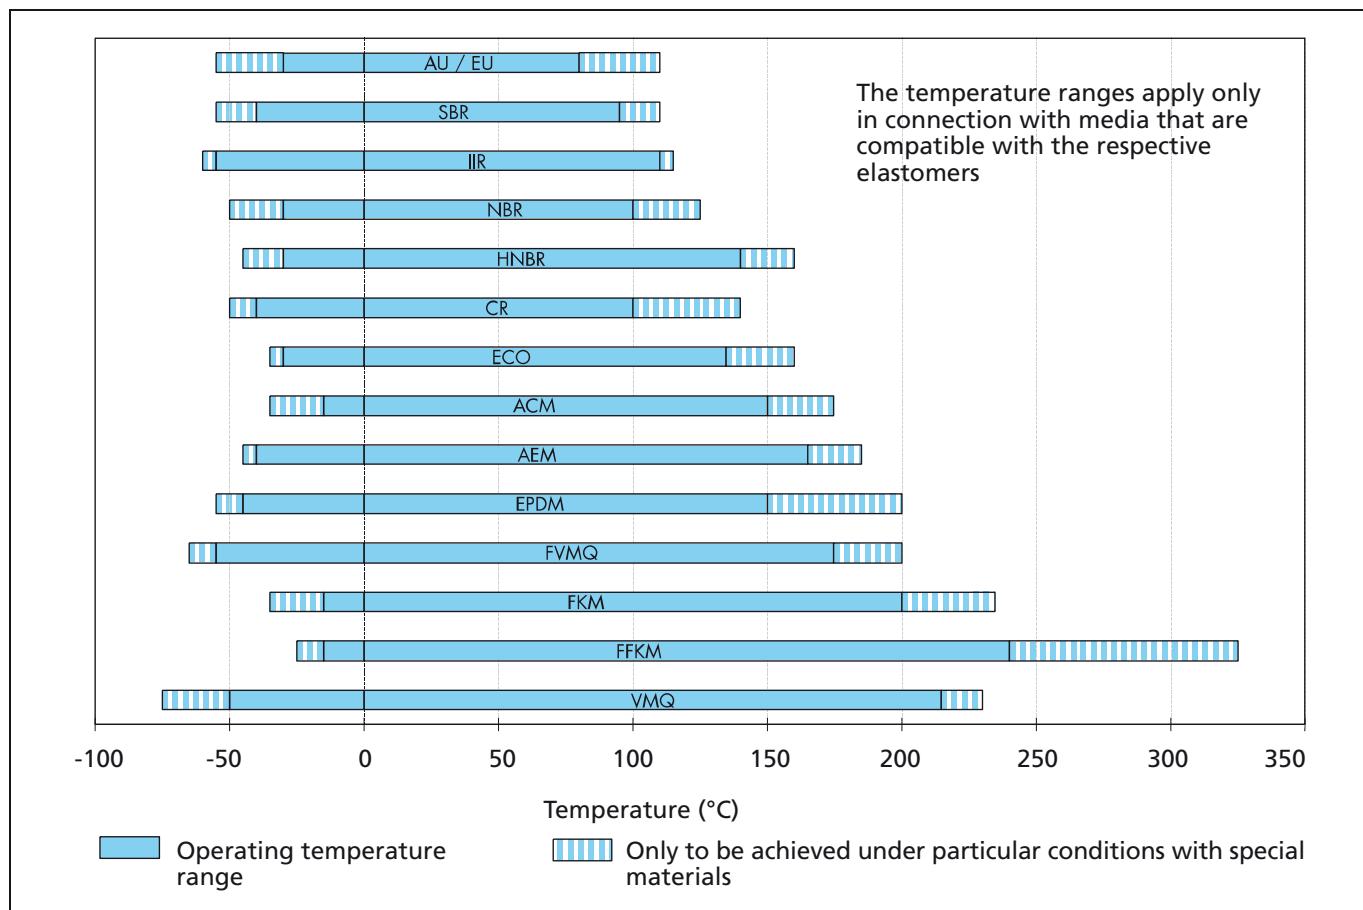

Figure 4 Temperature range of various elastomers

## General field of application

Elastomer materials are used to cover a large number of fields of application. Details regarding resistance in special media are shown in chapter "Chemical compatibility", page 9.

The various elastomers can be characterised as follows:

### NBR (Nitrile Butadiene Rubber):

The properties of the Nitrile Rubber depend mainly on the ACN content which ranges between 18% and 50%. In general they show good mechanical properties. The operating temperatures range between -30°C and +100°C (for a short period of time up to +120°C). Suitable formulated NBR can be used down to -60°C.

NBR is mostly used with mineral based oils and greases.

### FKM (Fluorocarbon Rubber)

Depending on structure and fluorine content FKM materials can differ with regards to their chemical resistance and cold-flexibility.

FKM is known especially for its non-flammability, low gas permeability and excellent resistance to ozone, weathering and aging.

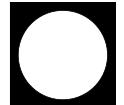

The operating temperatures of the Fluorocarbon Rubber range between -20°C and +200°C (for a short period of time up to +230°C). Suitable formulated FKM can be used down to -35°C. FKM is also often used with mineral based oils and greases at high temperatures.

### EPDM (Ethylene Propylene Diene Rubber)

EPDM shows good heat, ozone and aging resistance. In addition they also exhibit high levels of elasticity, good low temperature behaviour as well as good insulating properties.

The operating temperatures of applications for EPDM range between -45°C and +150°C (for a short period of time up to +175°C). With sulphur cured types the range is reduced to -45°C and +120°C (for short period of time up to +150°C).

EPDM can often be found in applications with brake fluids (based on glycol) and hot water.

## **HNBR** (Hydrogenated Nitrile Butadiene Rubber)

HNBR is made via selective hydrogenation of the NBR butadiene groups. The properties of the HNBR rubber depend on the ACN content which ranges between 18% and 50% as well as on the degree of saturation. HNBR shows good mechanical properties.

The operating temperature of HNBR ranges between -30°C and +140°C (for a short period of time up to +160°C) in contact with mineral oils and greases. Special types can be used down to -40°C.

## **VMQ** (Silicone Rubber)

VMQ shows excellent heat resistance, cold flexibility, dielectric properties and especially good resistance to weather, ozone and UV rays.

Specific VMQ formulations are resistant to aliphatic engine and gear oils, water up to +100°C and high-molecular chlorinated hydrocarbons. The temperature range is between -60°C and +200°C (temporary up to +230°C).

## **FVMQ** (Fluorosilicone Rubber)

FVMQ has a good heat resistance, very good low temperature flexibility, good electrical properties and excellent resistance to weather, ozone and UV rays. FVMQ shows a significant better chemical resistance than standard Silicone especially in hydrocarbons, aromatic mineral oils, fuel and low molecular aromatic hydrocarbons e.g. Benzene and Toluene. The temperature range is between -55°C and +175°C (temporary up to +200°C).

## **CR** (Chloroprene Rubber)

In general the CR materials show relatively good resistances to ozone, weathering, chemicals and aging. Also they show good non-flammability, good mechanical properties and cold flexibility.

The operating temperatures range between -40°C and +100°C (for a short period of time up to +120°C). Special types can be used down to -55°C.

CR materials are found in sealing applications such as refrigerants, for outdoor applications and in the glue industry.

## **ACM** (Polyacrylate Rubber)

ACM shows excellent resistance to ozone, weathering and hot air, although it shows only a medium physical strength, low elasticity and a relatively limited low temperature capability.

The operating temperatures range from -20°C and +150°C (for a short period of time up to +175°C). Special types can be used down to -35°C.

ACM-materials are mainly used in automotive applications which require special resistance to lubricants containing many additives (incl. sulphur) at high temperatures.

## **FFKM** (Perfluoro Rubber)

Perfluoroelastomers show broad chemical resistance similar to PTFE as well as good heat resistance. They show low swelling with almost all media.

Depending on the material the operating temperatures range between -25°C and +240°C. Special types can be used up to +325°C.

Applications for FFKM can be mostly found in the chemical and process industries and in all applications with either aggressive environments or high temperatures.

## **Polyurethane** (Zurcon® Polyurethane)

Polyurethanes are an exceptionally complex material group. They are individually designed and fit various applications' needs. Therefore it is not possible to unify the materials' properties.

Zurcon® polyurethane materials from Trelleborg Sealing Solutions are customized to appropriate applications and stand out due to their excellent elastic properties and optimum abrasion resistance. Outstanding tensile strength, low compression set and good resistance to O<sub>2</sub> and O<sub>3</sub> are further significant characteristics. Depending on the individual Zurcon® polyurethane type the application temperature range from below -50°C up to +110°C, temporary even higher, is feasible.

## Chemical compatibility

For the pre-selection of a suitable material group a comprehensive chemical compatibility guide is available. This can be downloaded from our website [www.tss.trelleborg.com](http://www.tss.trelleborg.com) or you can contact your local Trelleborg Sealing Solutions company for further details.

It is important to recognise that when using this guide, the ratings shown are based on published data and immersion tests. These tests are conducted under laboratory conditions predominantly at room temperature and may not represent adequately the conditions in the field. Relative short term laboratory tests may not pick up all the additives and impurities which may exist in long term service applications.

Care must be taken to ensure that all aspects of the application are considered carefully before a material is selected. For example at elevated temperatures some aggressive fluids can cause a much more marked effect on an elastomer than at room temperature.

Physical properties as well as fluid compatibility need to be considered. Compression set, hardness, abrasion resistance and thermal expansion can influence the suitability of a material for a particular application.

It is recommended that users conduct their own tests to confirm the suitability of the selected material for each application.

Our experienced technical staff can be consulted for further information on specific applications.

### B.1.3 Characteristics and inspection of elastomers

#### Hardness

One of the most often named properties regarding Polymer materials is hardness. Even so the values can be quite misleading.

Hardness is the resistance of a body against penetration of an even harder body - of a standard shape defined pressure.

There are two procedures for hardness tests regarding test samples and finished parts made out of elastomer material:

1. Shore A/D  
according to ISO 868 / ISO 7619 / DIN 53 505 /  
ASTM D 2240

Measurement for test samples

2. Durometer IRHD (International Rubber Hardness Degree) according to ISO 48 / ASTM 1414 and 1415  
Measurement of test samples and finished parts

The hardness scale has a range of 0 (softest) to 100 (hardest). The measured values depend on the elastic qualities of the elastomers, especially on the tensile strength.

The test should be carried out at temperatures of  $23 \pm 2^\circ\text{C}$  - not earlier than 16 hours after the last vulcanisation process (manufacturing stage). If other temperatures are being used this should be mentioned in the test report.

Tests should only be carried out with samples which have not been previously stressed mechanically.

#### Hardness tests according to Shore A / D

The hardness test device Shore A (indentor with pyramid base) is a sensible application in the hardness range 10 to 90. Samples with a larger hardness should be tested with the device Shore D (indentor with spike).

Test specimen:

Diameter min. 30 mm

Thickness min. 6 mm

Upper and lower sides smooth and flat

When thin material is being tested it can be layered providing minimal sample thickness is achieved by a maximum of 3 layers. All layers must be at minimum 2 mm thick.

The measurement is done at three different places at a defined distance and time.

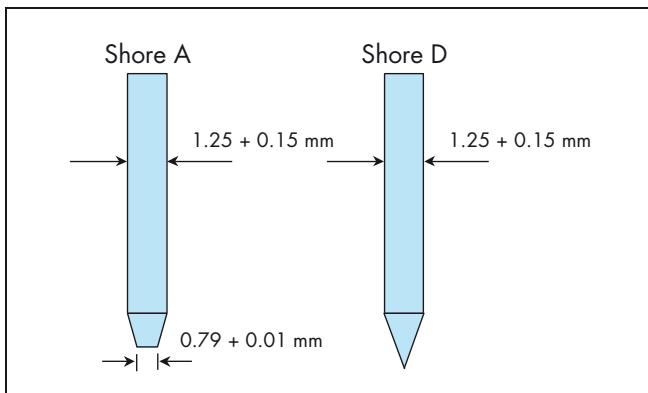

Figure 5 Indentor according to Shore A / D

#### Hardness test according to IRHD

The test of the Durometer according to IRHD is used with test samples as well as with finished goods.

The thickness of the test material has to be adjusted according to the range of hardness. According to ISO 48 there are two hardness ranges.

- |         |               |  |
|---------|---------------|--|
| Soft:   | 10 to 35 IRHD | ⇒ Sample thickness<br>10 to 15 mm / procedure "L"  |
| Normal: | over 35 IRHD  | ⇒ Sample thickness<br>8 to 10 mm / procedure "N"<br>Sample thickness<br>1.5 to 2.5 mm /<br>procedure "M" |

The hardness determined with finished parts or samples usually vary in hardness determined from specimen samples, especially those with a curved surface.

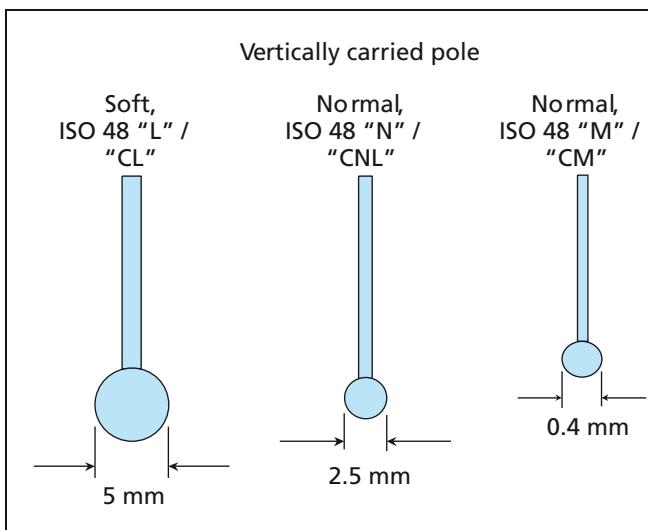

Figure 6 Indentor according to IRHD

## Influencing parameters on the hardness test for polymer materials

Various sample thicknesses and geometries as well as various tests can show different hardness values even though the same materials have been used.

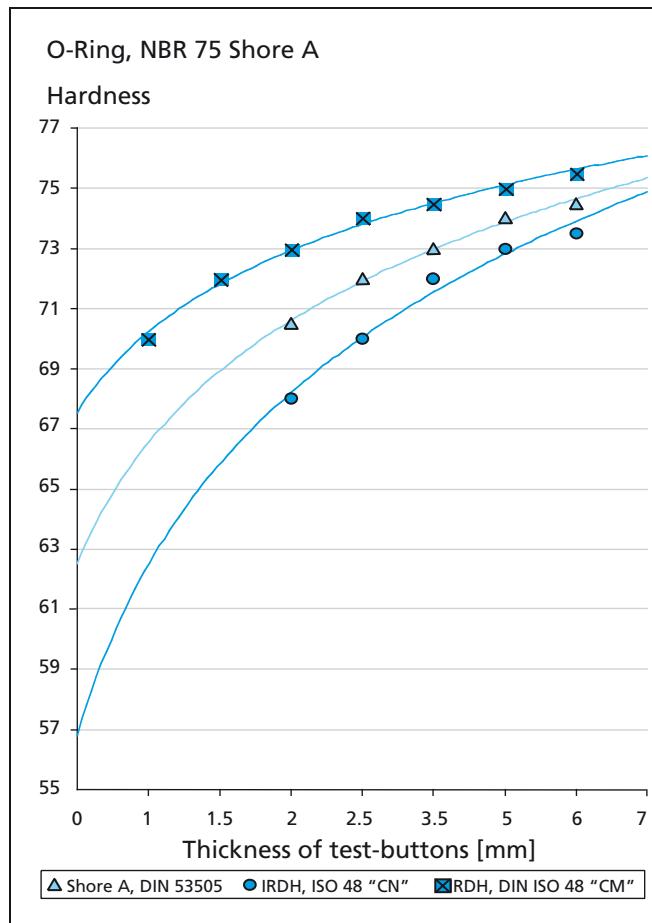

Figure 7 Ranges of hardness depending on sample thickness and test method

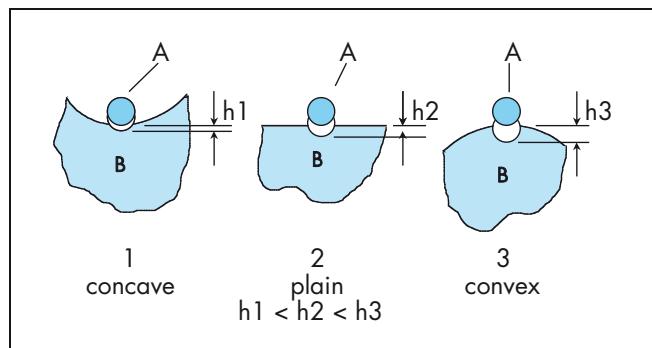

Figure 8 Range of hardness depending on surface geometry for the equivalent material characteristics.

With equivalent material characteristics of the elastomer sample B, the indentor penetrates the deepest at the surface 3 (convex) and therefore establishes the softest area.

As the concave geometry (3) has a stronger effect on smaller width O-Rings, the tolerances on hardness for widths under 2.0 mm should be increased up to +5 / -8 IRHD.

## Compression set

An important parameter regarding the sealing capability is the compression set (CS) of the O-Ring material. Elastomers when under compression show aside from an elastic element also a permanent plastic deformation (Figure 9).

The compression set is determined in accordance with ISO 815 as follows:

Standard test piece: Cylindrical disc, diameter 13 mm and height 6 mm  
Deformation: 25%  
Tension release time: 30 minutes

$$CS = \frac{h_0 - h_2}{h_0 - h_1} \cdot 100(\%)$$

Where  $h_0$  = Original height (cross section  $d_2$ )  
 $h_1$  = Height in the compressed state  
 $h_2$  = Height after tension release

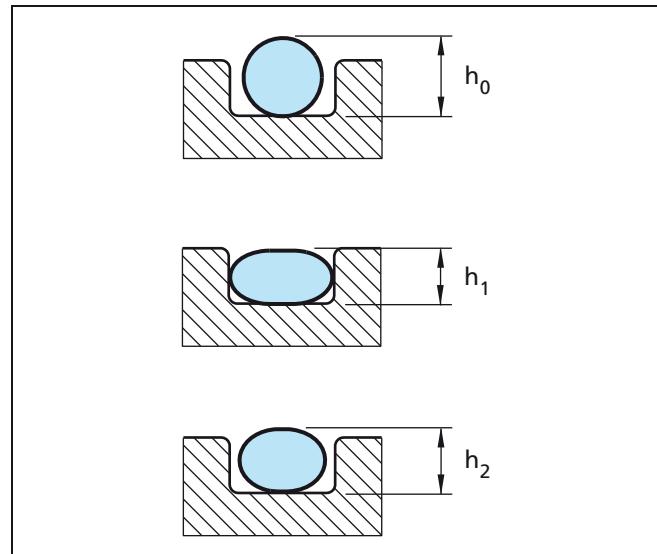

Figure 9 Illustration of the compression set

## O-Ring

The accuracy of the measured value depends on:

- Test sample thickness
- Deformation
- Measurement deviations

Therefore the values which have been identified with the test sample cannot be transferred onto the finished part. The result of the measured finished parts are strongly influenced by geometrics and measurements as well as the measuring accuracy of the test equipment.

The following illustration shows the influence of various measuring deviations (in mm) in respect to the established compression set CS depending on the cross section of the measured O-Rings.

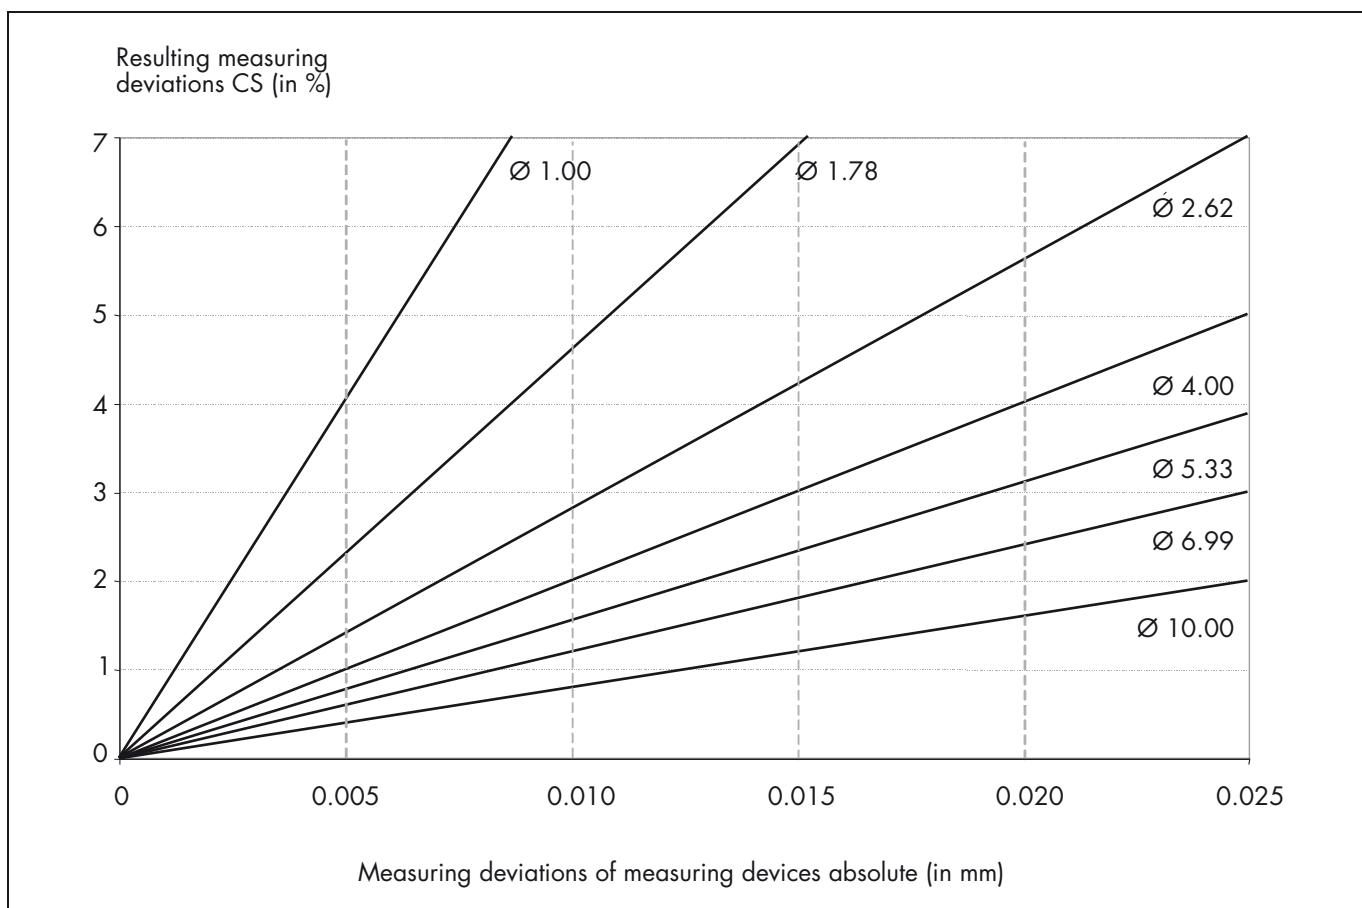

Figure 10 Measuring deviations CS depending on O-Ring cross section and measuring accuracy of the test equipment (schematic illustration)

## B.1.4 Special requirements - authorities and approvals

Seals often have to meet the highest performance standards and the most stringent of environment and safety demands.

Also official authorities and associations make great demands on seals or materials which are to be used in

their industries. This is often the case if seals are used for water or gas applications.

The following table shows common authorities and their requirements.

**Table IV Authorities and approvals**

Approval / Examination Certificate / Guideline	Application	Criteria / Standards	Tests / Examinations / Contents	Authorities / Associations	Institutes / Laboratories
ACS Licensing	Polymers exposed to drinking water	French Standard AFNOR XP P41-250, part 1-3 Synoptic Paper 1226	- Analysis of dispensing according "Synoptic Documents" - Storage test (microbe analysis)	ACS (Accréditation de conformité sanitaire)	3 certified test laboratories in France: Paris / Vandoeuvre / Lille
BAM recommendation	Seals for the use in gas or oxygen fittings	- reactive behaviour with lubricants - limits for pressure and temperature (DIN 4060) - seals and components		BAM (Bundesanstalt für Materialforschung und -prüfung)	BAM, Berlin
BfR Recommendation (former: BgVV)	Polymers exposed to food	BfR Guidelines ("Polymers exposed to food") various paragraphs, depending on the application of the seal	- Chemical and physical tests - Biological tests - Sterilisation tests - Taste tests	BfR (Bundesanstalt für Risikobewertung)	BAM, Berlin HY (Hygiene-Institut, Gelsenkirchen)

Trelleborg Sealing Solutions offers various materials, which provide additional advantages, in addition to the standard materials previously described. The advantages include a wide range of available molds, special operating temperature range, special media resistance and institutional approvals for the portable water, pharmaceutical and beverage industries.

The following table shows preferred materials, which are characterized by their wide spectrum of use. They can be used for standard applications as well as for special industrial applications.

**Table X Preferred materials**

Material Type	Hardness Shore A (± 5)	Color	Operating temperature range	Material code	Description
<b>NBR</b> Nitrile Butadiene Rubber	70	black	-30 °C to +100 °C	N7083	Preferable for <b>sizes acc. to AS 568 B</b> , preferably used for energizing elements, good overall performance
			-50 °C to +100 °C	N7T40	<b>"Polar"</b> , <b>extremely good low temperature properties</b> , preferably used for static applications in mineral oil and for energizing elements, preferable for sizes acc. to <b>AS 568 B</b>
			-30 °C to +100 °C	N7003	Preferable for metric sizes, good overall performance, wide range of molds available
			-30 °C to +100 °C	N7024	Good overall performance, <b>preferable for large quantities</b>
			-30 °C to +100 °C	N7027	Preferable for potable water applications: <b>KTW, ACS, NSF61, NSF51, DIN EN 549: 0 °C / 80 °C, W270, FDA</b> , also suitable for use in gas applications
	90	black	-25 °C to +100 °C	N9002	Good overall performance, <b>wide range of molds available</b>

# O-Ring

Material Type	Hardness Shore A ( $\pm 5$ )	Color	Operating temperature range	Material code	Description
<b>HNBR</b> Hydrogenated Nitrile Butadiene Rubber	70	black	-30 °C to +140 °C	H7671	Good overall performance, <b>wide range of molds available</b>
			-35 °C to +140 °C	H7503	<b>Wide range of operating temperature</b> , good resistance to mineral oil, good overall performance
<b>FKM</b> Fluorocarbon Rubber	70	green	-20 °C to +200 °C	V70GA	Preferable for <b>sizes acc. to AS 568 B</b> , preferably used for energizing elements, good overall performance, <b>DVGW, BAM</b>
			-18 °C to +200 °C	V70G2	Preferable for <b>sizes acc. to AS 568 B</b> , good overall performance
	75	black	-20 °C to +200 °C	VC009	Preferable for <b>sizes acc. to BS 4518</b> (metric), standard FKM
	80	green	-18 °C to +200 °C	V80G2	Good overall performance, <b>wide range of molds available</b>
			-18 °C to +200 °C	V8003	Good overall performance, <b>wide range of molds available</b>
		black	-20 °C to +200 °C	V8605	For pharmaceutical and food and beverage industries, <b>FDA</b>
	90	green	-15 °C to +200 °C	V90G1	Good overall performance, <b>wide range of molds available</b>
		black	-15 °C to +200 °C	V9670	Good overall performance, <b>wide range of molds available</b>
<b>EPDM</b> Ethylene Propylene Diene Rubber	70	black	-45 °C to +150 °C	E7502	Peroxide cured, for pharmaceutical and food and beverage industries, <b>KTW, WRAS, FDA, USP Class VI, USP 26</b> , plasticizer content < 3 %
			-45 °C to +125 °C	E7002	<b>Sulfur cured</b> , standard EPDM, wide range of molds available
			-45 °C to +140 °C	E7515	<b>Peroxide cured</b> , standard EPDM, wide range of molds available
			-45 °C to +150 °C	E7T41	Peroxide cured, <b>extremely low compression set</b> in hot water and steam. Excellent resistance to ozone, can be used in contact with copper and brass
			-45 °C to +140 °C	E7518	Peroxide cured, preferable for the use in potable water: <b>KTW, WRAS, FDA, NSF61, NSF51, W270, W534, EN 681, ACS, USP Class VI, USP 26</b> , plasticizer content < 1 %
<b>VMQ</b> Methyl Vinyl Silicon Rubber	60	red	-50 °C to +200 °C	S60R1	Good overall performance, <b>wide range of molds available</b>
	70	red	-50 °C to +200 °C	S70R2	<b>Sulfur cured</b> , good overall performance, <b>wide range of molds available</b>

The stated operating temperatures exclude any kind of load. Actual operating temperatures may differ depending on media and load type.

At time of publication the information contained in this literature, including availability or institutional approvals, is believed to be correct and accurate.

Further materials are available on request.

## B.2 Design recommendations

The following design recommendations cannot be used for the special Isolast® materials. Please use the Isolast® brochure or contact our specialists for further details.

### B.2.1 Installation recommendations

#### General recommendations

Before starting installation, check the following points:

- Lead-in chamfers made according to drawing?
- Bores deburred and edges rounded?
- Machining residues, e.g. chips, dirt and foreign particles, removed?
- Screw thread tips covered?
- Seals and components greased or oiled?  
Ensure media compatibility with the elastomer material. Trelleborg Sealing Solutions recommends to use the fluid to be sealed.
- Do not use lubricants with solid additives, e.g. molybdenum disulphide or zinc sulphide.

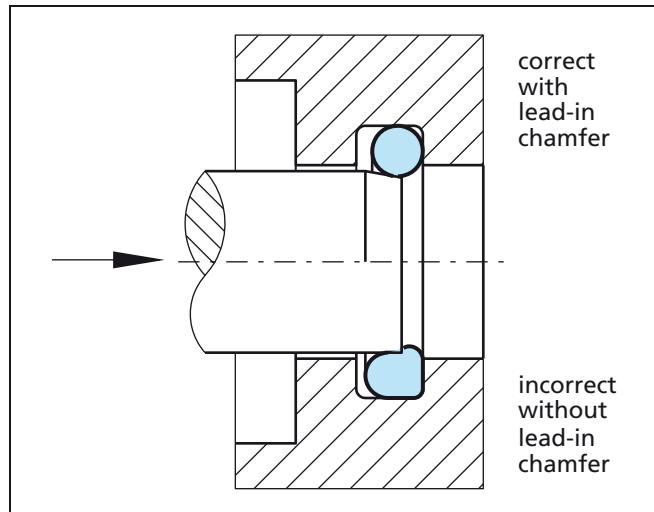

Figure 11 Rod installation with O-Ring

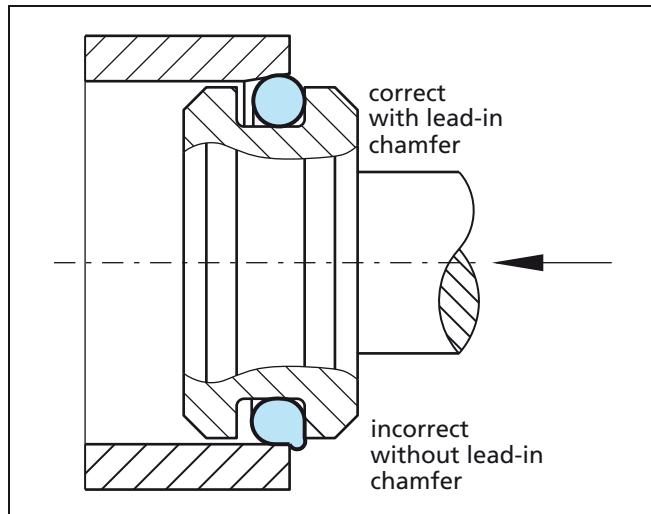

Figure 12 Piston installation with O-Ring

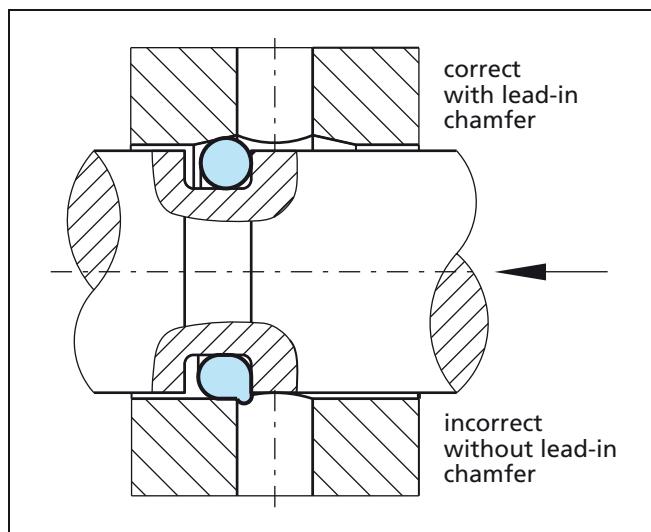

Figure 13 O-Ring installation over transverse bores

#### Manual installation

- Use tools without sharp edges!
- Ensure that the O-Ring is not twisted, use installation aids to assist correct positioning
- Use installation aids wherever possible
- Do not over stretch O-Rings
- Do not stretch O-Rings made out of cord at the joint.

## Installation over threads, splines etc.

Should the O-Ring have to be stretched over threads, splines, keyways etc., then an assembly mandrel is essential. This mandrel can either be manufactured in a soft metal or a plastic material obviously without burrs or sharp edges.

## Automatic installation

Automatic O-Ring installation requires good preparation. The surfaces of the O-Rings are frequently treated by several methods (see chapter "O-Ring friction reduced"). This offers a number of benefits during installation by

- Reducing the installation forces
- Non-stick effects, easy removal

The handling and installation of dimensionally unstable components requires a great deal of experience. Reliable automated installation thus demands special handling and packing of the O-Rings.

Please ask our specialists for further details.

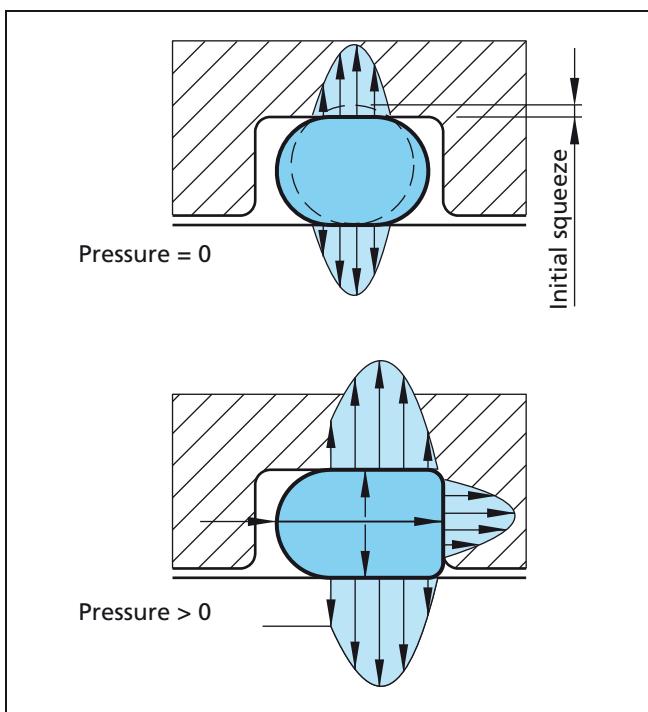

Figure 14 O-Ring contact pressure installed and under service pressure

## B.2.2 Initial compression

An initial compression (squeeze) of the O-Ring in the groove is essential to ensure its function as a primary or secondary sealing element (Figure 14). It serves to:

- Achieve the initial sealing capability
- Bridge production tolerances
- Assure defined frictional forces
- Compensate for the compression set
- Compensate for wear

Depending on the application, the following values apply for the initial squeeze as a proportion of the cross section ( $d_2$ ):

Dynamic applications: 6 to 20%  
Static applications: 15 to 30%

The design of the grooves can be based on the guide values for the initial squeeze shown in the diagrams in Figure 15 and 16. These take into account the relationship between loads and cross sections according to ISO 3601-2 (version 1987).

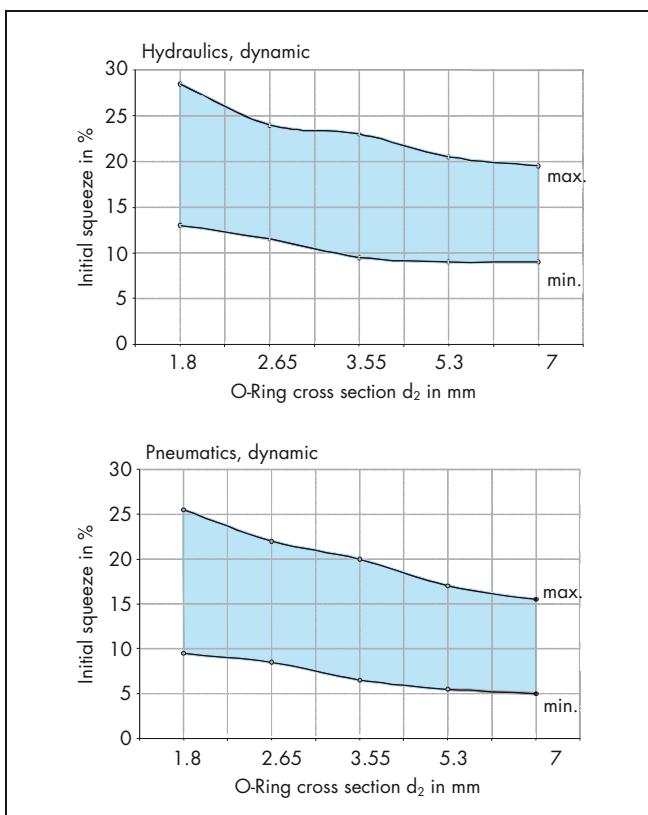

Figure 15 Permissible range of initial squeeze as a function of cross section, radial dynamic

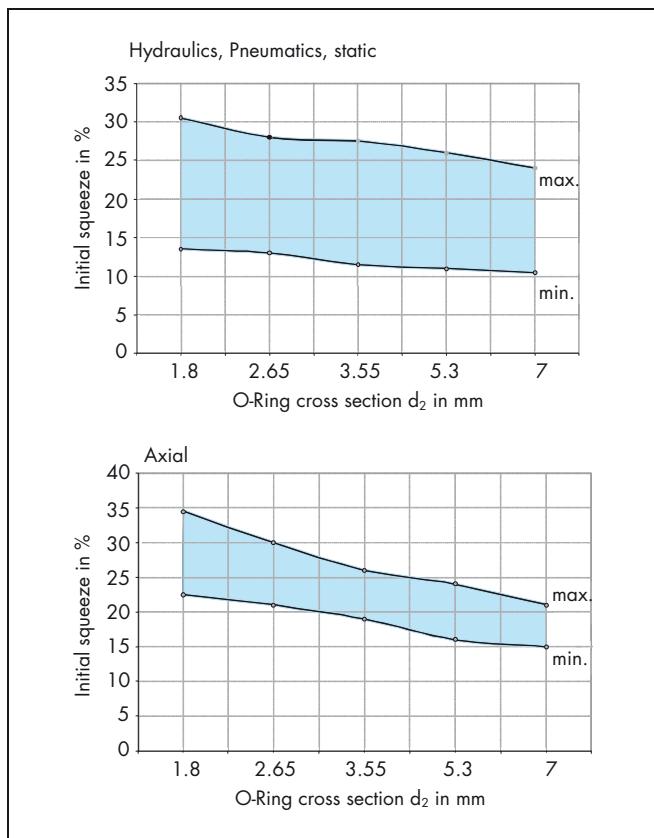

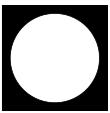

Figure 16 Permissible range of Initial squeeze as a function of cross section, radial static and axial

#### Compression forces

The deformation forces vary depending on the extent of the initial squeeze and the Shore hardness. Figure 17 shows the specific compression force per cm of the seal circumference as a function of the cross section.

The compression forces shown can be used to estimate the total force to be applied for static installation of O-Rings.

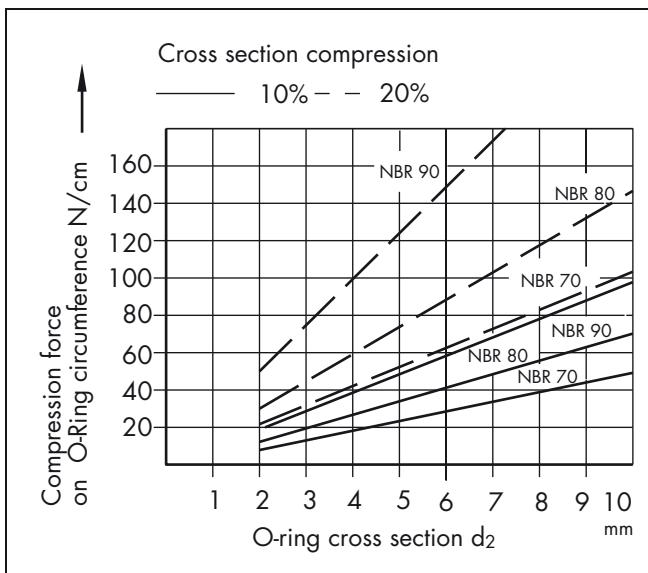

Figure 17 Compression forces on the O-Ring circumference depending on the material

#### B.2.3 Elongation - compression

With a radial sealing configuration, the O-Ring in an internal groove - "outside sealing" - should be stretched over the diameter of the groove. Maximum elongation in the installed state is 6% for O-Rings with an inner diameter > 50 mm and 8% for O-Rings with an inner diameter < 50 mm.

With external grooves - "inside sealing" - the O-Ring is preferably compressed along its circumference. The maximum circumferential compression in the installed state is 3%.

Exceeding these values will result in too large increase or decrease in the O-Ring cross section. Consequently this can effect the service life of the seal.

The reduction in cross section diameter (d<sub>2</sub>) can be calculated as

$$\text{Reduction}_{\max} = \frac{d_{2\min}}{10} \cdot \sqrt{6 \cdot \left( \frac{d_{3\max} - d_{1\min}}{d_{1\min}} \right)}$$

with d<sub>1min</sub> = minimum inside diameter of the O-Ring

d<sub>2min</sub> = minimum cross section of the O-Ring

d<sub>3max</sub> = maximum housing diameter

but for approximation it can be assumed, in percentage, to be half the amount of stretch. An elongation of 1% corresponds to a reduction of the cross section (d<sub>2</sub>) of approx. 0.5%.

## B.2.4 Methods of installation and design of seal housing

### Methods of installation

O-Rings can be used in components in a wide variety of ways.

During the design stage installation must be taken into consideration. In order to avoid damage during installation it should not be necessary to pass the O-Ring over edges or bores. When long sliding movements are involved, the seal seat should be recessed, if possible, or the O-Rings arranged so that they only have to travel short distances during installation to reduce risk of twisting.

Radial installation (static and dynamic)

#### Inner sealing

The O-Ring size should be selected so that the inside diameter  $d_1$  has the smallest possible deviation from the diameter to be sealed  $d_5$  (Figure 18).

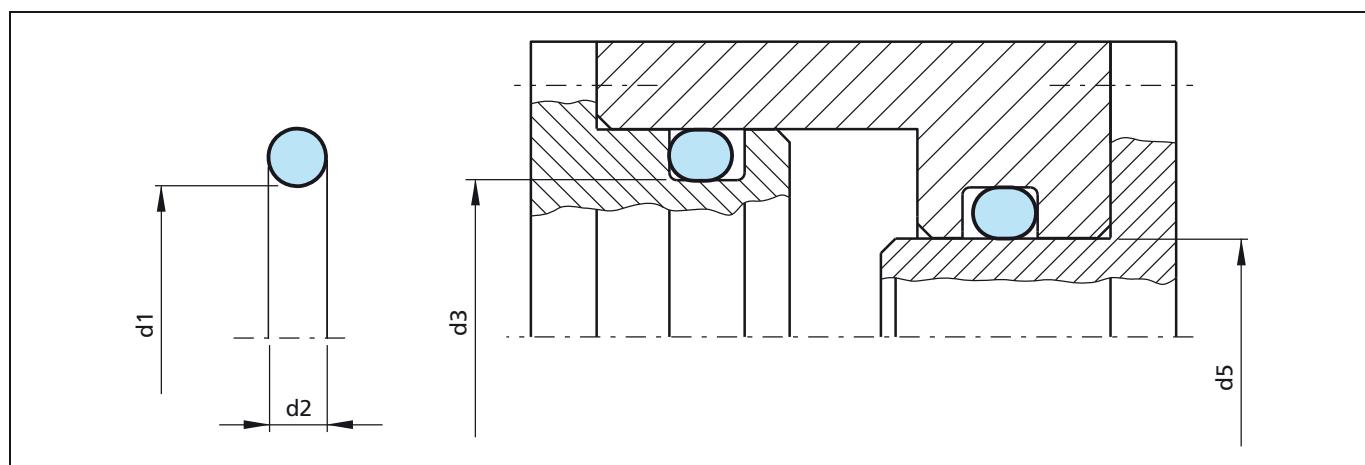

Figure 18 Radial installation, static and dynamic

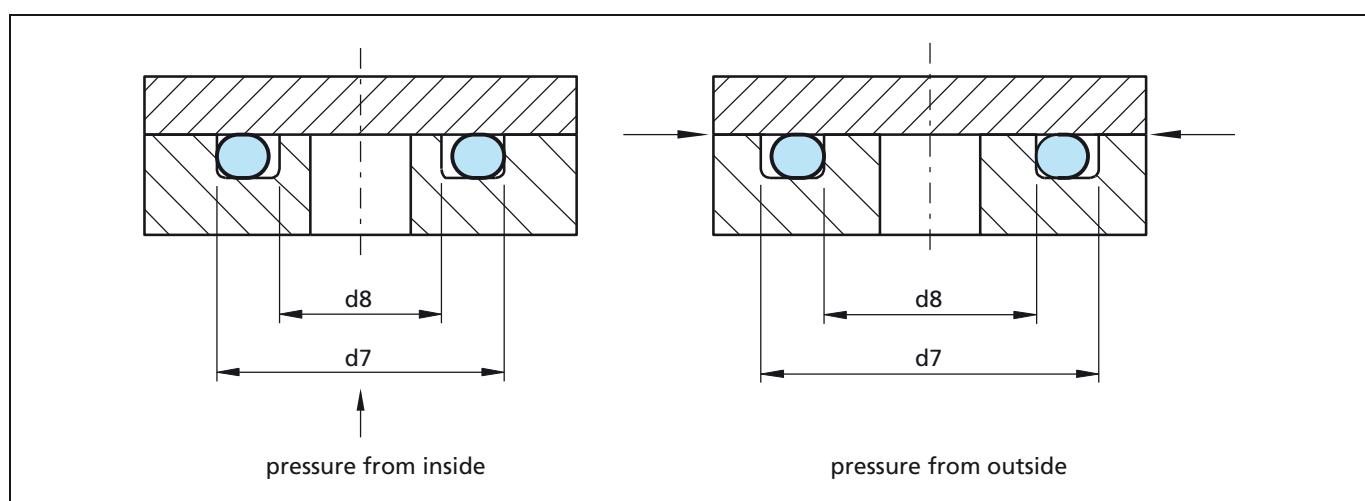

Figure 19 Axial installation, static

## O-Ring

### O-Ring as a rotary seal

In some applications, e.g. with short running periods, the O-Ring can also be used as a rotary seal for sealing shafts. In this case, the following points should be observed:

In order to be able to function as a rotary seal, O-Rings must be installed in accordance with specific guidelines, the rotary seal principle.

The rotary seal principle is based on the fact that an elongated elastomer ring contracts when heated (Joule effect). With the normal design criteria the O-Ring inside diameter  $d_1$  will be slightly smaller than the shaft diameter, and the heat generated by friction would cause the ring to contract even more. This results in a higher pressure on the rotating shaft so that a lubricating film is prevented from forming under the seal and even higher friction occurs. The result would be increased wear and a premature failure of the seal.

Using the rotary seal principle, this is prevented by the seal ring being selected so that its inside diameter is approximately 2 to 5% larger than the shaft diameter to be sealed. The installation in the groove means that the seal ring is compressed radially and is pressed against the shaft by the groove diameter. The seal ring is thus slightly corrugated in the groove, a fact which helps to improve the lubrication.

Special materials are available for rotary seal applications. Trelleborg Sealing Solutions does not recommend the use of O-Rings as rotary seals. Please contact your local Trelleborg Sealing Solutions company for further details.

### Technical data

O-Rings can be used in a wide range of applications. Temperature, pressure and media determine the choice of appropriate materials. In order to be able to assess the suitability of the O-Ring as a sealing element for a given application, the interaction of all the operating parameters have to be taken into consideration.

#### Working Pressure

##### Static application

- up to 5 MPa for O-Rings with inside diameter > 50 mm without Back-up Ring
  - up to 10 MPa for O-Rings with inside diameter < 50 mm without Back-up Ring
    - (depends on the material, the cross section and the clearance)
- up to 40 MPa with Back-up Ring
- up to 250 MPa with special Back-up Ring

Please note the permissible extrusion gaps.

##### Dynamic application

- Reciprocating up to 5 MPa without Back-up Ring
- Higher pressures with Back-up Ring

#### Speed

Reciprocating up to 0.5 m/s

Rotating up to 0.5 m/s

Depending on material and application.

#### Temperature

From -60 °C to +325 °C

Depending on material and media resistance.

When assessing the application criteria, the peak and continuous operating temperature and the running period must be taken into consideration. For rotating applications the temperature increase due to frictional heat must be taken into account.

#### Media

With the wide range of the available materials, each with different properties, it is possible to seal against practically all liquids, gases and chemicals. Please note when selecting the most suitable material the information in chapter "B.1 Materials", and in our O-Ring Material Guide.

## Groove design / Groove dimensions

### Lead-in chamfers

Correct design can help to eliminate possible sources of damage and seal failure from the outset.

Since O-Ring are squeezed during installation, lead-in chamfers and rounded edges must be provided (Figure 20 and 21).

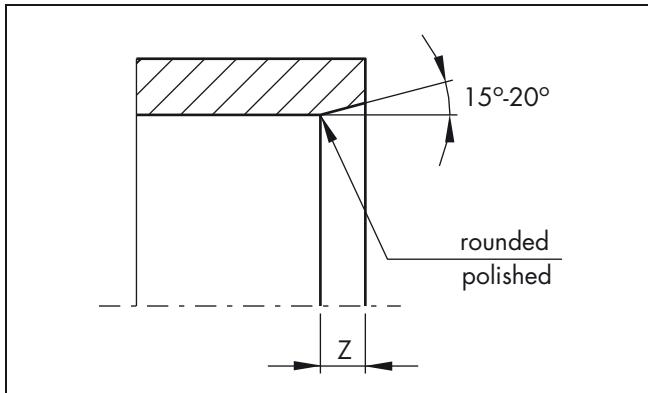

Figure 20 Lead-in chamfers for bores, tubes

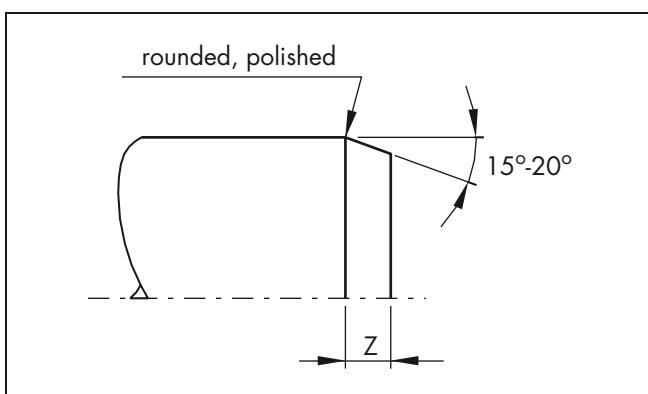

Figure 21 Lead-in chamfers for shafts, rods

The minimum length of the lead-in chamfer is listed in table XI as a function of the cross section  $d_2$ .

**Table XI Lead-in chamfers**

Lead-inchamfers length Z min.		O-Ring cross section $d_2$
15°	20°	
2.5	1.5	up to 1.78 1.80
3.0	2.0	up to 2.62 2.65
3.5	2.5	up to 3.53 3.55
4.5	3.5	up to 5.33 5.30
5.0	4.0	up to 7.00
6.0	4.5	above 7.00

The surface roughness of a lead-in chamfer is:  
 $R_z \leq 6.3 \mu\text{m}$      $R_a \leq 0.8 \mu\text{m}$

### Radial clearance

The tolerances given in table XV and the maximum permissible radial clearance  $S$  (extrusion gap) given in the table XII must be maintained.

If the clearance is too large, there is a risk of seal extrusion which can result in the destruction of the O-Ring (Figure 22).

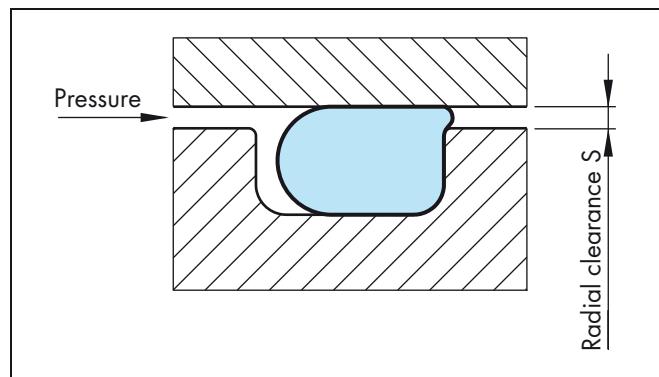

Figure 22 Radial clearance "S"

The permissible radial clearance  $S$  between the sealed parts depends on the system pressure, the cross section and the hardness of the O-Ring.

Table XII contains recommendations for the permissible clearance  $S$  as a function of O-Ring cross section and shore hardness. The table is valid for elastomeric materials with the exception of polyurethane and FEP encapsulated O-Rings.

For pressure above 5 MPa for O-Rings with Inside diameter > 50 mm and above 10 MPa for O-Rings with Inside diameter < 50 mm we recommend the use of Back-up Rings.

# O-Ring

**Table XII Radial clearance S**

O-Ring cross section $d_2$	up to 2	2 - 3	3 - 5	5 - 7	above 7
O-Rings with hardness of 70 Shore A					
Pressure MPa	Radial clearance S				
≤ 3.50	0.08	0.09	0.10	0.13	0.15
≤ 7.00	0.05	0.07	0.08	0.09	0.10
≤ 10.50	0.03	0.04	0.05	0.07	0.08
O-Rings with hardness of 90 Shore A					
Pressure MPa	Radial clearance S				
≤ 3.50	0.13	0.15	0.20	0.23	0.25
≤ 7.00	0.10	0.13	0.15	0.18	0.20
≤ 10.50	0.07	0.09	0.10	0.13	0.15
≤ 14.00	0.05	0.07	0.08	0.09	0.10
≤ 17.50	0.04	0.05	0.07	0.08	0.09
≤ 21.00	0.03	0.04	0.05	0.07	0.08
≤ 35.00	0.02	0.03	0.03	0.04	0.04

These values assume that the parts are fitted concentrically to one another and do not expand under pressure. If this is not the case, the clearance should be kept correspondingly smaller.

For static applications we recommend a fit of H8/f7.

O-Rings made from polyurethane can bridge larger clearances thanks to their high extrusion resistance and greater dimensional stability. See also chapter "Polyurethane O-Rings".

## Surfaces

Under pressure, elastomers adapt to irregular surfaces. For gas or liquid tight joints, however, certain minimum demands must be made on the surface quality of the surfaces to be sealed.

Fundamentally grooves, scratches, pit marks, concentric or spiral machining scores, etc. are not permissible. Higher demands must be placed on dynamic mating surfaces than on static surfaces.

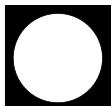

At present no uniform definitions exist for describing the mating surfaces. In practice, the specification of the  $R_a$  value is not sufficient to permit an assessment of the surface quality. Our recommendations therefore contain amongst others various terms and definitions in accordance with DIN 4768 and DIN EN ISO 4287.

**Table XIII Surface finish**

Type of Load	Surface	$R_t \mu\text{m}$	$R_z \mu\text{m}$	$R_a \mu\text{m}$
Radial-dynamic	Mating surface * (bore, rod, shaft)	1.0 - 2.5	0.63 - 1.6	0.1 - 0.4
	groove flanks, groove diameter	≤ 10.0	≤ 6.3	≤ 1.6
Radial-static Axial-static	Mating surface groove flanks, groove diameter	≤ 10.0 ≤ 16.0	≤ 6.3	≤ 1.6
	For pulsating pressures Mating surface groove flanks, groove diameter	≤ 6.3 ≤ 10.0	≤ 6.3	≤ 0.8 ≤ 1.6

\* spiralfree grinding

The above is for guidance only and covers the majority of sealing applications. However Trelleborg Sealing Solutions should be consulted in areas of particular concern.

## Trapezoidal groove

The trapezoidal (dovetail) groove should only be used in special cases, e.g. overhead installation, in order to retain the O-Ring (Figure 23). The installation dimensions are summarised in table XIV. The trapezoidal groove is only recommended for O-Ring cross section from 3.53 mm. The inside diameter of the O-Ring results from the mean groove diameter minus the cross section.

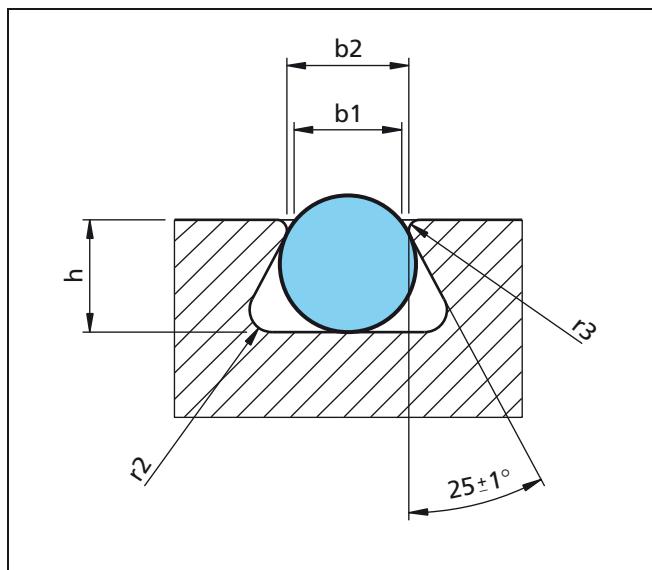

Figure 23 Installation in trapezoidal groove

**Table XIV Installation dimensions for trapezoidal groove**

O-Ring cross section <b>d<sub>2</sub></b>	Groove dimensions				
	Groove width <b>b<sub>1</sub> ±0.05</b>	Groove width <b>b<sub>2</sub> ±0.05</b>	Groove depth <b>h ±0.05</b>	Radius (max.)	
<b>r<sub>3</sub></b>	<b>r<sub>2</sub></b>				
3.53 3.55	2.90	3.20	2.90	0.25	0.80
4.00	3.40	3.70	3.20	0.25	0.80
5.00	4.30	4.60	4.20	0.25	0.80
5.33 5.30	4.60	4.90	4.60	0.25	0.80
5.70	4.75	5.25	4.80	0.40	0.80
6.00	5.05	5.55	5.10	0.40	0.80
7.00	6.00	6.50	6.00	0.40	1.60
8.00	6.85	7.45	6.90	0.50	1.60
8.40	7.25	7.85	7.30	0.50	1.60

## Rectangular groove

A rectangular groove is preferred for all new designs. Designs with bevelled groove flanks up to 5° are permissible. If Back-up Rings are used, straight groove flanks are necessary.

To reduce risk of extrusion the radius  $r$  ideally should not exceed the maximum permissible radial clearance  $S$  (see table XII).

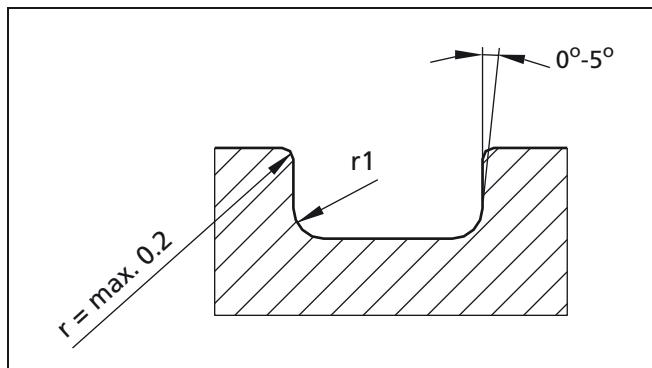

Figure 24 Groove specifications

# O-Ring

## Installation recommendations

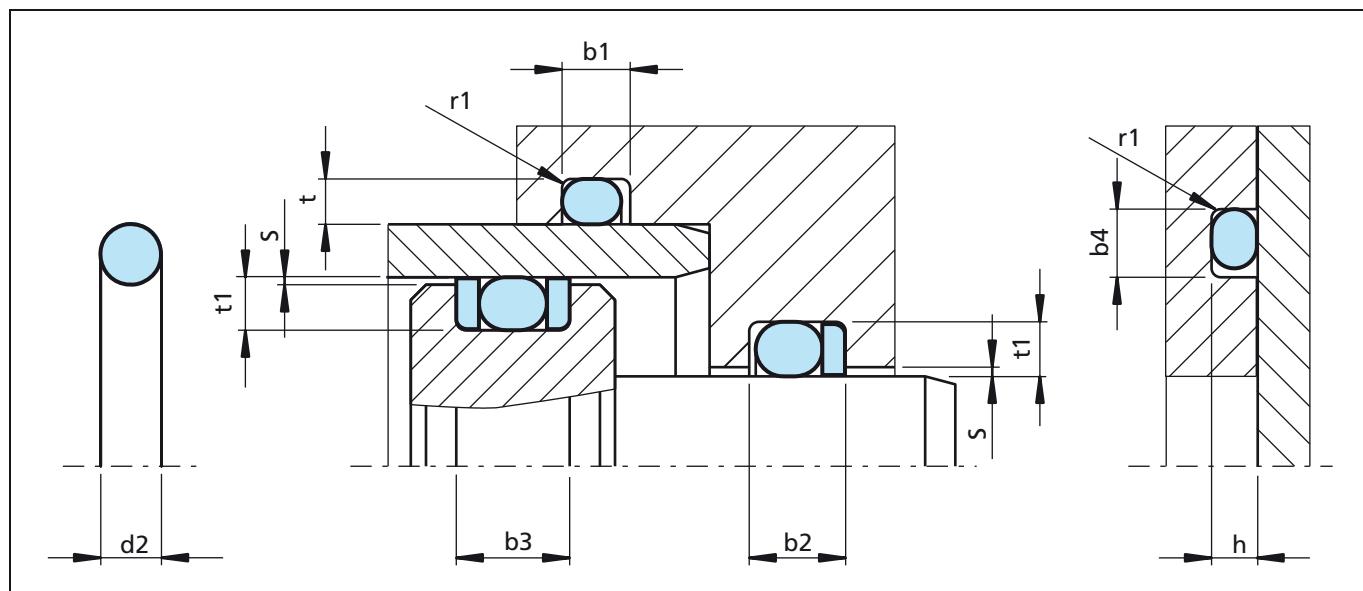

Figure 25 Installation drawing

Radial clearance, see chapter "Design Recommendations", page .

Surface specifications, see chapter "Design Recommendations", page .

Groove width b2 and b3: When using Back-up Rings the groove is to be widened by the corresponding Back-up Ring thickness (b2: one Back-up Ring, b3:two Back-up Rings).

12.00	11.00	<b>10.60</b>	13.50	10.60	14.00	2.00

\* Preferred sizes

1) If a Back-up Ring is used the recommended radius r1 should always be  $r1=0.25 \pm 0.2\text{mm}$ .

The given installation dimensions cannot be used for FFKM materials (Isolast®). Please use the Isolast® brochure or contact our specialists for further details.

## C Dimensions and product range

### C.1 Dimensions and international standards

#### C.1.1 O-Ring range of sizes

The following table provides a summary of available O-Ring dimensions, TSS part numbers and valid standards.

The table represents a guide to common dimensions with or without a valid standard and makes no claim to be exhaustive. The complete range of sizes is more extensive. Special dimensions are also available on request. Please contact our specialists for further details.

For the given dimensions moulds generally exist. Due to different shrinkage factors of various materials, it may not be possible to process certain materials with the existing moulds.

To guarantee a high and constant quality level it might be necessary to produce new or additional moulds with the corresponding costs.

At the time of publication O-Ring moulds for the dimensions according to AS 568 B (ORAR . . .) exist for standard NBR 70 Shore A and standard FKM 70 Shore A. Subject to alterations.

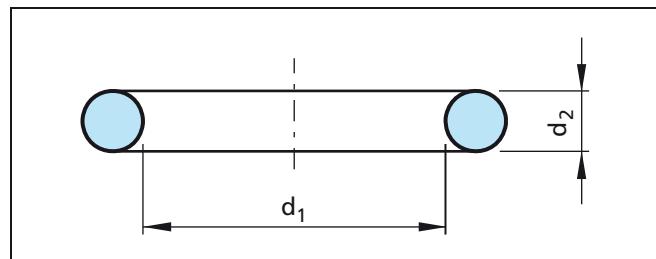

Figure 26 O-Ring dimensions

#### Ordering example 1

O-Ring, metric 40 x 3

Dimensions: Inside diameter = 40.0 mm  
Cross section = 3.0 mm

Material: NBR 70  
(Nitrile-Butadiene Rubber  
70 Shore A)

TSS Article No.	OR3004000	-	N7
TSS Art. - Group			
Cross section x 10			
Inside diameter x 100			
Quality Index (Standard)			
Material code (Standard)			

#### Ordering example 2

O-Ring, American Standard AS 568 B, ref. 149

Dimensions: Inside diameter = 71.12 mm  
Cross section = 2.62 mm

Material: FKM 80  
(Fluorocarbon Rubber  
80 Shore A)

TSS Article No.	ORAR00149	-	V8
TSS Art. - Group			
Standard AS 568 B			
Part No. (Dash-No.)			
Quality Index (Standard)			
Material code (Standard)			

O-Ring dimensions and TSS part numbers see tables XVI to XIX.

Material codes (elastomer type) for standard product order see table I (last column).

The required Shore hardness must be given with the order.

When a special material is required the exact five-digit Trelleborg Sealing Solutions material code must be given with the order. In this respect please refer to the information provided in Table X Preferred materials or contact your local Trelleborg Sealing Solutions company.

# O-Ring

## C.1.3 O-Ring dimensions for straight thread tube fitting sizes, AS 568 B

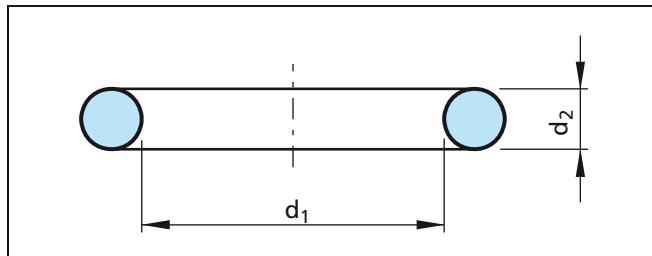

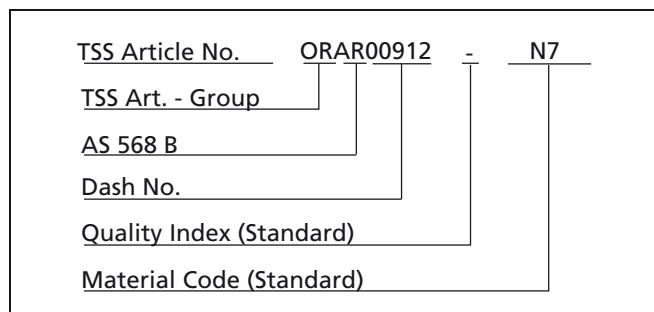

Figure 28 O-Ring dimensions

### Ordering example

O-Ring according to AS 568 B

Dimensions: Inside diameter  $d_1 = 23.47$  mm  
Cross section  $d_2 = 2.95$  mm  
Compound: NBR 70  
Nitrile-Butadiene Rubber 70 Shore A

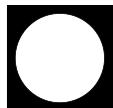

O-Ring dimensions and TSS part numbers see table XVIII. Material codes (elastomer type) for standard product order see table I (last column). The required Shore hardness must be given with the order.

When a special material is required the exact five-digit Trelleborg Sealing Solutions material code must be given with the order. In this respect please refer to the information provided in table X Preferred materials or contact your local Trelleborg Sealing Solutions company.

## C.2 Tolerances of dimensions

During vulcanisation, elastomers are subject to dimensional changes due to shrinkage. The degree of shrinkage depends on material, mould geometry and on the vulcanisation process employed.

The following tables XX and XXI show the tolerances for the inside diameter ( $d_1$ ) and cross section ( $d_2$ ). The tables are valid for all 70 Shore A Nitrile (NBR) elastomer materials; other materials may exhibit different dimensional tolerances if they are produced from moulds designed for NBR 70 materials. To guarantee a high and constant quality level it might be necessary to produce new or additional moulds with the corresponding costs.

Precision O-Rings with reduced tolerances are available if required - please contact your local Trelleborg Sealing Solutions company. O-Ring dimensions not included in the tables are manufactured with tolerances according to the TSS standard TBS-00024, based on ISO 3601-1:1987.

**Table XXI Tolerances for O-Ring inside diameters  $d_1$  acc. to ISO 3601-1:1987**

Inside diameter $d_1$	Tolerances $\pm$
$d_1 \leq 2.50$	0.13
$2.50 < d_1 \leq 4.50$	0.16
$4.50 < d_1 \leq 6.30$	0.19
$6.30 < d_1 \leq 8.50$	0.22
$8.50 < d_1 \leq 10.00$	0.25
$10.00 < d_1 \leq 11.20$	0.28
$11.20 < d_1 \leq 14.00$	0.31
$14.00 < d_1 \leq 16.00$	0.34
$16.00 < d_1 \leq 18.00$	0.37
$18.00 < d_1 \leq 20.00$	0.39
$20.00 < d_1 \leq 21.00$	0.41
$21.00 < d_1 \leq 22.50$	0.43
$22.50 < d_1 \leq 24.00$	0.45
$24.00 < d_1 \leq 25.50$	0.47
$25.50 < d_1 \leq 27.00$	0.49
$27.00 < d_1 \leq 28.50$	0.51
$28.50 < d_1 \leq 30.00$	0.53
$30.00 < d_1 \leq 31.50$	0.55
$31.50 < d_1 \leq 33.00$	0.57
$33.00 < d_1 \leq 34.50$	0.59
$34.50 < d_1 \leq 36.00$	0.61
$36.00 < d_1 \leq 37.50$	0.63
$37.50 < d_1 \leq 38.70$	0.65
$38.70 < d_1 \leq 40.00$	0.67

**Table XX Cross section tolerances acc. to the TSS standard TBS-00024, based on ISO 3601-1:1987**

Cross section $d_2$	Tolerances $\pm$
$\leq 1.80$	0.08
$1.80 < d_2 \leq 2.65$	0.09
$2.65 < d_2 \leq 3.55$	0.10
$3.55 < d_2 \leq 5.30$	0.11
$5.30 < d_2 \leq 7.00$	0.12
$7.00 < d_2 \leq 8.00$	0.13
$8.00 < d_2 \leq 10.00$	0.14

**Attention!**  
 Since November 18, 2008 the new dimension tolerances according to Trelleborg Sealing Solutions O-Rings.  
 ISO 3601-1:2008, Class B apply to Trelleborg Sealing Solutions O-Rings.  
 See separate attachment to this catalog.

## C.3 O-Ring quality acceptance criteria

ISO 3601-3 defines permissible form and surface deviations of elastomeric O-Rings. Distinctions are made in the table between permissible flaw sizes according to type characteristics.

### Type characteristic N

O-Rings falling under this characteristic meet the requirements made on a standard quality. They satisfy the demands made on static and dynamic seals.

### Type characteristic S

O-Rings falling under type characteristic S are subject to exceptional demands, e.g. for safety relevant components in automobile engineering. The permissible flaw sizes are very limited. This demands a greater process technology

and stricter quality control procedures. The following tables define the form and surface deviations of Trelleborg Sealing Solutions Elastomer O-Rings for standard quality as well as for reduced tolerances. The given values are according to the TSS standard TBS-00005, based on ISO 3601-3:2005, grade N and respectively S.

If no quality requirements are specified with the order, O-Rings are supplied with standard quality according to table XXII (acc. to TSS standard TBS-00005, based on ISO 3601-3:2005, grade N).

For surface deviations ISO 2859-1:2004-01 AQL 1,0 general inspection level II is supplied as standard. Higher quality levels are available on request.

## C.4 Seal set

The rapid availability of spare parts is very important during the servicing maintenance and repair of machines and equipment.

### O-Ring Set, Type A

390 O-Rings in 24 different Sizes to American Standard AS 568 B and British Standard BS 1806			
TSS Article No. ORSETAASS-N7 (NBR 70)			
Quantity	Dimensions (mm)	Quantity	Dimensions (mm)
30	2.90 x 1.78	10	18.77 x 1.78
30	3.69 x 1.78	15	9.20 x 2.62
30	4.47 x 1.78	15	10.78 x 2.62
30	5.28 x 1.78	15	12.37 x 2.62
30	6.07 x 1.78	10	17.12 x 2.62
30	7.65 x 1.78	10	18.72 x 2.62
30	9.25 x 1.78	10	20.30 x 2.62
20	10.82 x 1.78	5	18.64 x 3.53
20	12.42 x 1.78	5	20.22 x 3.53
10	14.00 x 1.78	5	21.82 x 3.53
10	15.60 x 1.78	5	23.38 x 3.53
10	17.17 x 1.78	5	24.99 x 3.53

We offer a variety of standard ranges which are supplied in sturdy cases as a set with foam inlays.

### O-Ring Set, Type B

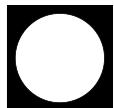

295 O-Rings in 24 different Sizes to American Standard AS 568 B and British Standard BS 1806			
TSS Article No. ORSETBASS-N7 (NBR 70)			
Quantity	Dimensions (mm)	Quantity	Dimensions (mm)
15	20.35 x 1.78	15	34.52 x 3.53
15	21.95 x 1.78	10	36.09 x 3.53
15	25.07 x 2.62	10	37.69 x 3.53
15	26.64 x 2.62	10	40.87 x 3.53
15	28.24 x 2.62	10	44.04 x 3.53
15	29.82 x 2.62	10	47.22 x 3.53
15	31.42 x 2.62	10	50.39 x 3.53
15	32.99 x 2.62	10	37.47 x 5.33
15	34.59 x 2.62	10	40.64 x 5.33
15	29.74 x 3.53	10	43.82 x 5.33
15	31.34 x 3.53	5	46.99 x 5.33
15	32.92 x 3.53	5	50.17 x 5.33

### O-Ring Set, Type C

380 O-Rings in 24 different Sizes, common Metric Sizes			
TSS Article No. ORSETCMET-N7 (NBR 70)			
Quantity	Dimensions (mm)	Quantity	Dimensions (mm)
20	4.00 x 2.00	15	10.30 x 2.40
20	6.00 x 2.00	15	11.20 x 2.40
20	8.00 x 2.00	15	12.30 x 2.40
20	10.00 x 2.00	15	13.30 x 2.40
20	12.00 x 2.00	15	14.30 x 2.40
20	3.30 x 2.40	10	10.00 x 3.00
20	4.30 x 2.40	10	12.00 x 3.00
20	5.30 x 2.40	10	14.00 x 3.00
20	6.30 x 2.40	10	16.00 x 3.00
20	7.30 x 2.40	10	18.00 x 3.00
20	8.30 x 2.40	10	19.20 x 3.00
20	9.20 x 2.40	5	20.00 x 3.00

### O-Ring Set, Type D

295 O-Rings in 24 different Sizes, common Metric Sizes			
TSS Article No. ORSETDMET-N7 (NBR 70)			
Quantity	Dimensions (mm)	Quantity	Dimensions (mm)
15	18.00 x 2.00	15	35.00 x 4.00
15	20.00 x 2.00	15	38.00 x 4.00
15	25.00 x 3.00	15	40.00 x 4.00
15	26.20 x 3.00	10	42.00 x 4.00
15	28.00 x 3.00	10	45.00 x 4.00
15	29.20 x 3.00	10	46.00 x 4.00
15	32.20 x 3.00	10	48.00 x 4.00
15	34.20 x 3.00	10	35.00 x 5.00
15	36.20 x 3.00	10	40.00 x 5.00
15	30.00 x 4.00	10	45.00 x 5.00
15	32.00 x 4.00	5	48.00 x 5.00
15	34.00 x 4.00	5	50.00 x 5.00

## D Special O-Rings

### D.1 Isolast® (FFKM) O-Rings

Information about our Isolast® (FFKM) O-Rings are available either in our special Isolast® brochure or through your local Trelleborg Sealing Solutions company.

### D.2 FEP encapsulated O-Rings

FEP encapsulated O-Rings consist of an elastomer inner ring and a seamless FEP sheath which surrounds the elastomer ring.

Similar to PTFE O-Rings FEP encapsulated O-Rings are used wherever the chemical resistance of normal elastomer O-Rings are not sufficient.

The required elasticity is provided by the elastomer ring, the chemical resistance by the seamless FEP sheath.

#### Advantages

- Very good chemical resistance to most liquids and chemicals, with the exception of liquid alkaline metals and some fluorine compounds
- Temperature application range from approx. -60 °C to +200 °C (depending on the material for the inner ring)
- Can be used with foodstuffs, pharmaceutical and medicinal products
- Physiologically safe and can be sterilised
- Low friction, no adhesion or stick-slip effect
- Adequate elastic behaviour for improved sealability.

#### Versions

- Standard versions: Elastomer O-Ring with FEP sheath  
Special versions: Hollow elastomer ring with FEP sheath

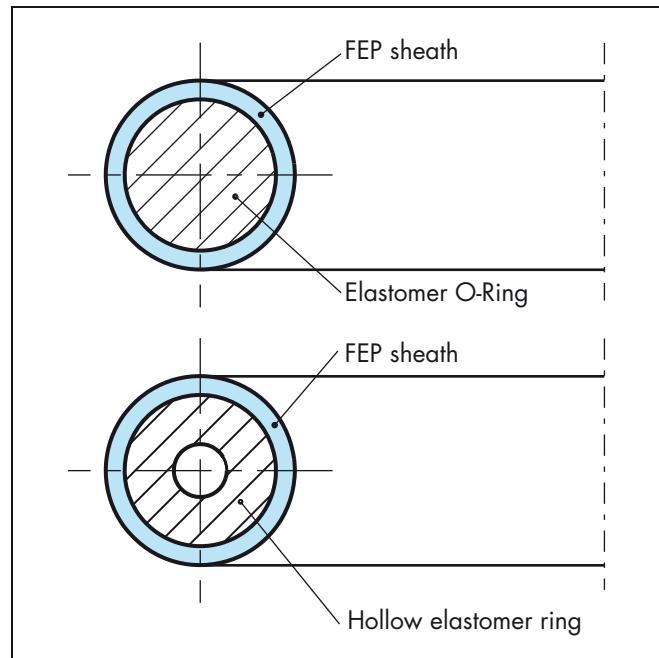

Figure 29 Different versions of FEP O-Ring

## Applications

### Fields of application

FEP encapsulated O-Rings are ideally suited for use in the chemical, petrochemicals, medical technology, foodstuffs, water, sewage and similar sectors of industry. A typical application for FEP encapsulated O-Rings is the sealing of valve spindles and as secondary sealing elements for mechanical seals.

FEP encapsulated O-Rings are used primarily as static seals. They are also suitable for use as sealing elements for slow switching and rotary movements.

In the chemical process industry, seals with special sealing profiles are frequently required. For such applications, we manufacture special seals for various flange cross sections either from drawings or from templates (Figure 30).

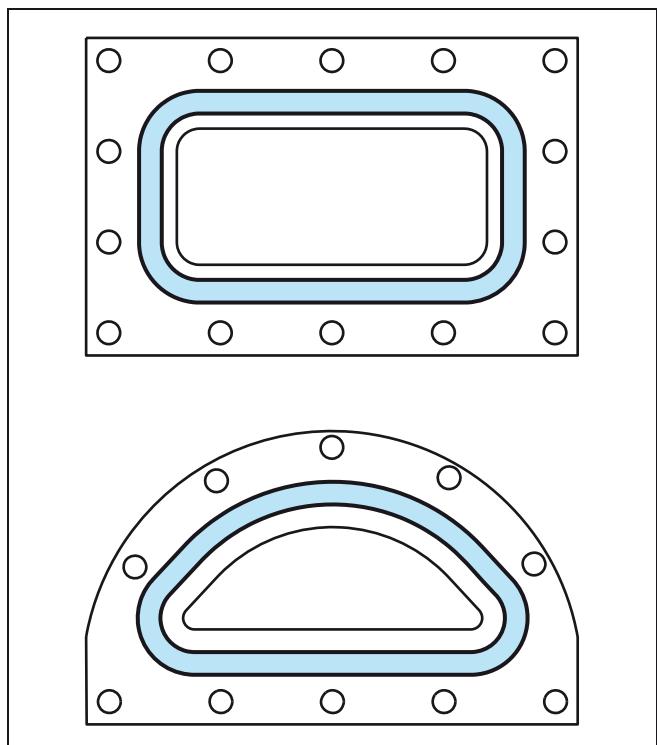

Figure 30 Seals for special flange cross sections

## Technical data

Working pressure: Up to 25 MPa

Temperature: - 60 °C to + 200 °C - depending on the elastomer material

Media: Practically all liquids, gases and chemicals

## Materials

### FEP sheath

FEP is the abbreviated designation for Tetrafluoroethylene-hexafluoropropylene. This material has similar properties to those of Polytetrafluoroethylene (PTFE). It also has a very high chemical resistance and exhibits a good resistance to abrasion.

In contrast to PTFE, however, FEP is thermoplastically mouldable. This allows the material to be processed to form flexible semifinished products, such as thin-walled hoses.

### Inner ring

A choice of two materials is available for the elastomer inner rings. The choice of the material also determines the service temperature range.

- Fluoroelastomer (FKM), material code VZ00R temperature range: - 20 °C up to + 200 °C
- Silicone elastomer (VMQ), material code SZ00R temperature range: - 60 °C up to + 200 °C

The specified temperature ranges are limits which must always be considered in conjunction with the medium to be sealed and the working pressure. The permissible continuous operating temperatures are always lower than the upper limits.

### Design recommendations

FEP encapsulated O-Rings are fully interchangeable with standard O-Ring seals. There is no need to modify the groove dimensions. The FEP sheath is relatively thin-walled.

All the specifications given in this catalogue therefore refer to the installation dimensions of elastomer O-Rings.

As a result of the FEP sheath, the O-Rings are less flexible than elastomer O-Rings. They have limited stretch and higher permanent deformation.

Split grooves are recommended, especially for outside sealing FEP encapsulated O-Rings, in order to avoid overstretching during installation.

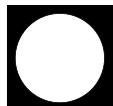

The general information on the construction, design and surfaces given for the elastomer O-Rings applies also to FEP encapsulated O-Rings.

At higher pressures, additional concave Back-up Rings should be used.

### Application in gases

Where the O-Ring is used to seal gases, the permeation rate must be taken into consideration. In this case the material of the inner ring must also have a good resistance to the medium to be sealed. The permeation rate depends on the exposed surface area, the temperature, the working pressure and the thickness of the FEP sheath.

The thickness of the FEP sheath can be found in table XXIV.

**Table XXIV Thickness of the FEP sheath**

O-Ring		Thickness of the FEP Sheath
Cross section d <sub>2</sub>	Tolerance ±	
1.78 1.80	0.10	0.20
2.62 2.65	0.10	0.30
3.53 3.55	0.12	0.38
5.34 5.30	0.25	0.50
7.00	0.38	0.50

The diagram (Figure 31) gives guide values for the permeation of different gases.

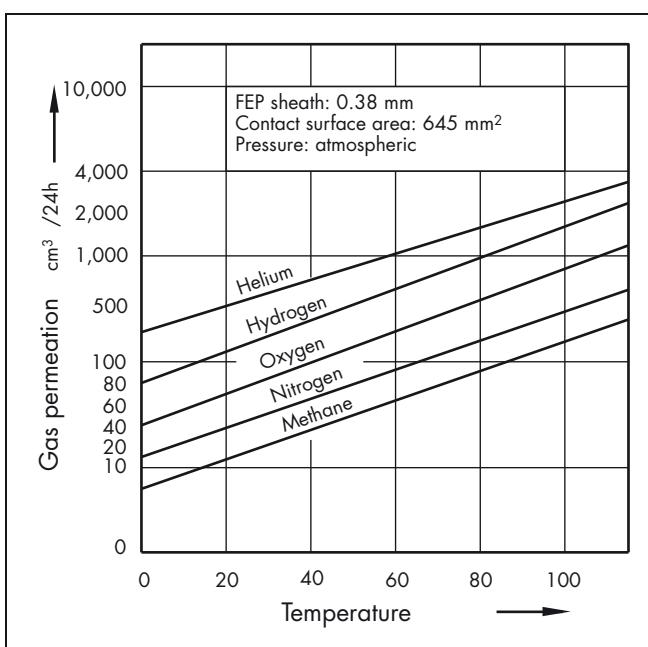

Figure 31 Gas permeation rates for FEP O-Rings

The diagram (Figure 32) gives guide values for the permeation of water vapour.

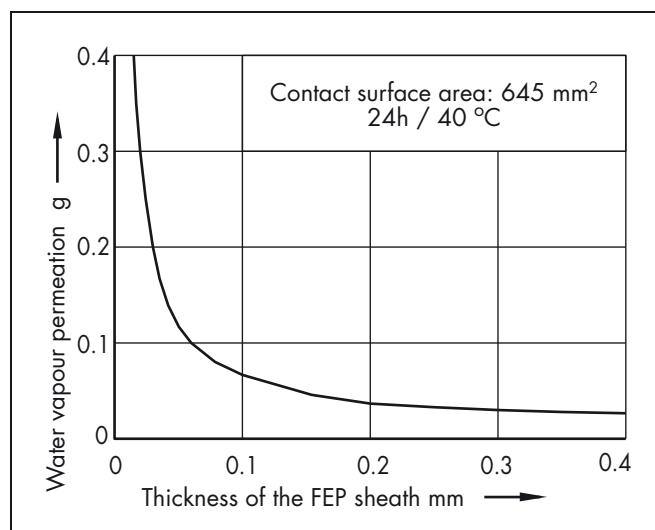

Figure 32 Water vapour permeation for FEP O-Rings

## Methods of installation

The same recommendations apply to the installation of FEP encapsulated O-Rings as for standard elastomer O-Rings. It should be noted, however, that the O-Rings have only limited stretch due to the FEP sheath.

If, for design reasons, a split groove is not possible, auxiliary tools must be used for installation.

For inside sealing applications (e.g. rod), FEP encapsulated O-Rings can be installed with larger diameters without tools. On no account should the seal ring be forced into the groove (e. g. by bending), otherwise the sealing function cannot be assured.

# O-Ring

## Dimensions

FEP encapsulated O-Rings are available in the same sizes as the elastomer O-Rings. Table XXVI shows the smallest available inside diameters for the different cord diameters.

**Table XXV Tolerances inside diameter**

Inside diameter (mm)	Tolerance ID ( $\pm$ mm)
$d_1 < 7.64$	not available
$7.64 \leq d_1 \leq 30.00$	0.25
$30.00 < d_1 \leq 130.00$	0.38
$130.00 < d_1 \leq 170.00$	0.51
$170.00 < d_1 \leq 380.00$	0.64
$380.00 < d_1 \leq 650.00$	0.76
$650.00 < d_1 \leq 1000.00$	1.52
$d_1 > 1000.00$	on request

# O-Ring

## Ordering example

O-Ring 30 x 3, FEP sheathed

Dimensions: Inside diameter  $d_1 = 30.0$  mm  
Cross section  $d_2 = 3.0$  mm

Material of the inner ring: Silicone Rubber (VMQ)

TSS Article No.	OF3003000	-	SZ00R
TSS Part No.			
Quality Index (Standard)			
Material Code (Standard)			

Further information see page 31

## Ordering example

O-Ring, FEP sheathed  
American Standard AS 568 B, ref. 356

Dimensions: Inside diameter  $d_1 = 135.89$  mm  
Cross section  $d_2 = 5.33$  mm

Material of the inner ring: Fluorocarbon Rubber (FKM)

TSS Article No.	O FAR00356	-	VZ00R
TSS Part No.			
Quality Index (Standard)			
Material Code (Standard)			

Further information see page 31

O-Ring dimensions and TSS Part No. see Table XVI, page 32-97.

Installation dimensions, see Table XV, page 28.

Ordering can also be made according to O-Ring dimensions and material.

### D.3 PTFE O-Rings

O-Rings in Polytetrafluoroethylene (PTFE) are closed, circular rings with annular cross section. The dimensions are - as with the elastomer O-Ring - characterised by the inside diameter  $d_1$  and the cord diameter  $d_2$  (Figure 33). PTFE O-Rings are not moulded but produced by machining. The rings can therefore be manufactured in all sizes.

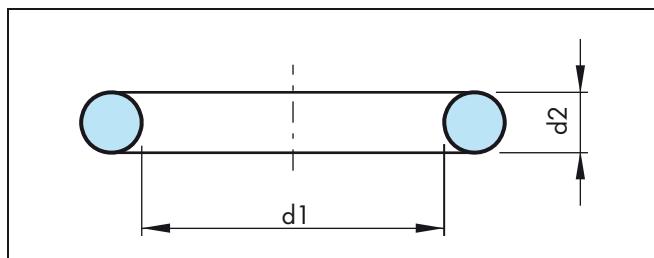

Figure 33 O-Ring dimensions

#### Advantages

- Very good chemical resistance, compatible with most liquids and chemicals, with the exception of liquid alkaline metals and some fluorine compounds.
- Wide temperature range from approx. -200 °C to +260 °C
- Suitable for contact with foodstuffs, pharmaceutical and medicinal products
- Physiologically safe, can be sterilised
- Low friction, no adhesion
- Available for all diameters up to approx. 1,000 mm.

### Applications

#### Fields of application

PTFE O-Rings are used wherever the chemical and thermal resistance of the normal elastomer O-Rings is no longer sufficient. These are primarily applications in the chemical industry, foodstuffs industry, pharmaceuticals and medical technology. PTFE O-Rings are used only as static seals, e.g. on flange connections, on covers, etc.

#### Technical data

Working pressure:	Up to 40 MPa
Temperature:	-200 °C to +260 °C
Media:	Practically all liquids, gases and chemicals

#### Materials

Standard material: Virgin, unfilled PTFE (polytetrafluoroethylene), Material Code PT00

PTFE is a partially crystalline thermoplastic characterised by a very high chemical and thermal resistance. PTFE has the highest resistance to chemicals of all plastics and can be used for almost any application. It has a slightly limited resistance to molten alkaline metals, to elementary fluorine and to certain halogen materials.

The material undergoes no changes on exposure to ageing, light and ozone. The water absorption rate is less than 0.01%.

#### Design recommendations

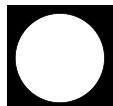

PTFE O-Rings have low elasticity. The O-Ring size should therefore be chosen to suit the nominal diameter (rod or bore) to be sealed. Installation in axial easily accessible and radial split grooves is to be preferred.

The general information on the construction, design and surfaces given for the elastomer O-Rings applies also to PTFE O-Rings.

#### Methods of installation

PTFE O-Ring can only be stretched or compressed to a very limited extent during installation.

During installation, e.g. on flanges, the cold flow tendency of the thermoplastic PTFE should be taken into consideration. Under pressure, PTFE deforms plastically also in the cold state, i.e. a permanent deformation takes place. If flange seals are not tightened sufficiently to give metal/metal contact, the elastic deformation and thus the elastic tension can deteriorate.

## Installation recommendations

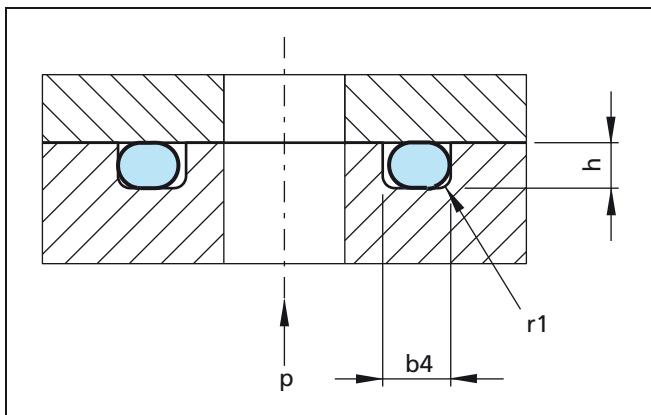

Figure 34 Axial installation, static, inside pressure

Table XXVII Installation dimensions

Cross section $d_2$	Groove dimensions		Radius $r_1$
	Groove depth $h +0.05$	Groove width $b_4 +0.1$	
1.50	1.30	1.7	0.2
1.60	1.40	1.8	0.3
1.78 1.80	1.60	2.0	0.4
2.00	1.80	2.2	0.5

### D.4 Polyurethane O-Rings

Polyurethane is becoming more and more widely used as a sealing material due to its exceptionally high abrasion resistance and high extrusion resistance.

The polyurethane materials from Trelleborg Sealing Solutions have a number of improved properties.

Polyurethane is therefore an ideal material for O-Rings and sealing elements.

The outstanding properties of the materials play a major role particularly in our Zurcon® materials.

Polyurethane O-Rings are available in dimensions to American Standard AS 568 B (see dimension list, table XXVIII, page 124).

The dimensions are given with the inside diameter "d<sub>1</sub>" and the cord diameter "d<sub>2</sub>" (Figure 35, page 123).

#### Advantages

The main advantages of a polyurethane material for O-Rings compared with other elastomer are the outstanding mechanical properties:

- High abrasion and wear resistance tolerates aggressive operating conditions
- High extrusion resistance allows increased pressures or extrusion gaps
- Good mechanical properties improve service life
- Low friction reduces breakout forces on start up

### Applications

#### Fields of application

Polyurethane O-Rings are especially suited wherever O-Rings are subject to dynamic loads.

This includes for example, applications in hydraulics, pneumatics and in a wide range of other critical areas. In many cases, polyurethane O-Rings are used instead of NBR in view of their high mechanical strengths.

Due to their particularly high abrasion resistance, polyurethane O-Rings are more suitable than other materials in applications where bores have to be crossed or where frequent opening and closing is demanded, e.g. plug connectors and couplings.

Polyurethane O-Rings in 70 Shore A hardness material WU7TI can, with advance, be used in applications such as pneumatics where low compression set and low friction are essential.

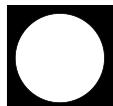

#### Technical data

Working pressure:	Static up to approx. 60 MPa without Back-up Ring (depending on the extrusion gap) Dynamic up to 25 MPa
Speed:	Reciprocating up to $\leq 0.2$ m/s
Temperature:	-45 °C up to +100 °C depending on the material
Media:	Hydraulic fluids and mineral oil-based greases and air.

#### Materials

The most important characteristics of these polyurethanes are:

- High tensile strength
- Low compression set
- Very good cold flexibility
- Constant shear modulus even at high temperatures
- Resistant to weathering and ageing
- High damping properties
- Low gas permeability
- Good hydrolysis resistance
- High tear propagation resistance
- Free from substances which hinder paint coverage

Polyurethane materials are resistant in:  
Mineral oils and greases, oxygen, ozone.

Polyurethane compounds are not resistant in:  
Esters, aromatic and chlorinated hydrocarbons,  
concentrated acids and lyes.

Polyurethane O-Rings are available on request in the  
following grades:

Polyurethane, 70 Shore A  
Material code WU7T1

Polyurethane, 92 Shore A  
Material code WU9T2

Polyurethane, 93 Shore A, Zurcon®:  
Material code Z22 and Z24

Polyurethane, 94 Shore A, Zurcon®:  
Material code Z20

Depending on the production method Zurcon® O-Rings can  
have an injection point on the inside diameter. This  
marking is placed at a 45° angle from the flash.

## Design instructions

The same design rules apply to polyurethane O-Rings as to  
other elastomer O-Rings, i.e. the same installation  
dimensions (groove depth, groove width), see Table XV,  
page 28.

Radial clearance

In view of the high extrusion resistance of polyurethane,  
larger clearances can be bridged with polyurethane  
O-Rings than with other elastomers, without the additional  
installation of Back-up Rings.

The permissible radial clearance is depending on the used  
material, on the O-Ring cross section and on the application  
properties, e. g. the temperature.

## O-Ring dimensions

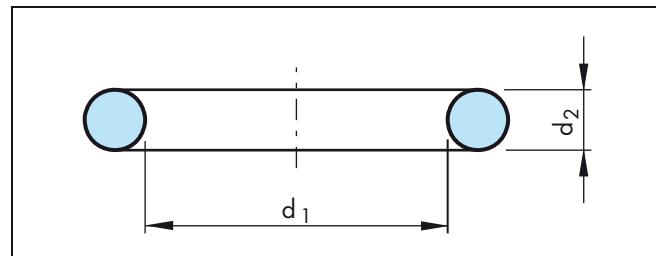

Figure 35 O-Ring dimensions

## Ordering Example

O-Ring, American Standard AS 568 B, ref. 214

Dimensions: Inside diameter  $d_1 = 24.99$  mm  
Cross section  $d_2 = 3.53$  mm

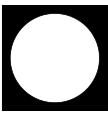

Material: Polyurethane (AU 70 Shore A)

O-Ring dimensions and TSS Part No. see table XXVIII.

Installation dimensions, see table XV, page 28.

Ordering can also be made according to O-Ring dimensions  
and material.

Tolerances based on ISO 3601. See tables XX and XXI.

## D.5 Round cord rings (butt vulcanised)

Round cords are produced by extrusion. They are supplied as cut lengths. The most common materials are NBR 70 Shore A, EPDM 65 Shore A and FKM 75 Shore A. Other materials are available on request.

In contrast to mold-vulcanised O-Rings, round cord rings made from continuously extruded cord can be made up to any desired diameter.

The junction point always has poorer mechanical properties than the basic material. For this reason, round cord rings should be used with caution for dynamic applications, gaseous media or vacuum.

The O-Ring tolerances according to ISO 3601-1 (resp. TBS-00024) are applicable for the inside diameter  $d_1$  but not for the cross section  $d_2$ . Tolerances for the cross sections see tables below.

For the use of round cord rings in high-vacuum applications it is recommendable to use FKM. In that case the joint has to be manufactured in a special high-vacuum quality and has to be ordered accordingly. Please contact your local Trelleborg Sealing Solutions company for further details.

**Table XXIX Available cross sections and valid tolerances for EPDM 70 Shore A**

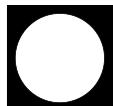

Cross section (mm)	Tolerance
2.00	$\pm 0.30$
2.50	
3.00	$\pm 0.35$
3.50	
4.00	$\pm 0.40$
5.00	
5.30	$\pm 0.40$
5.70	
6.00	$\pm 0.45$
7.00	
8.00	$\pm 0.50$
9.00	
9.50	$\pm 0.50$
10.00	
11.00	$\pm 0.70$
12.00	
13.00	$\pm 0.70$
14.00	
15.00	$\pm 0.90$
18.00	
20.00	

The tolerances stated are valid for round cord rings (butt-vulcanised) only and refer to the cross section. Due to the applied pressure during the vulcanisation process the junction point can be thinner than the cord. In general this has no negative effect on the sealing function.

The article number of round cord rings starts with OV.

**Table XXX Available cross sections and valid tolerances for FKM 75 Shore A**

Cross section (mm)	Tolerance
1.78	$+ 0.3 / - 0.1$
2.00

## D.6 O-Ring surface treatments

In many cases standard elastomeric O-Rings cannot be used without a modified surface. Friction can be one of the reasons. Also the possible contamination of the systems through extraction of material components is often not acceptable.

Therefore O-Rings can be surface-treated by special ways of cleaning, dipping, spraying or coating in order to reduce friction and adhesion, achieve permanent lubrication or facilitate installation.

Depending on the desired effect several high-quality surface treatments or coatings can be used. These are described in the following sections.

For further details regarding surface treatments, coatings and cleaning of seals please refer to the separate brochure "Friction-free Running" or contact your local Trelleborg Sealing Solutions company.

## E.1 Quality criteria

The cost-effective use of seals and bearings is highly influenced by the quality criteria applied in production. Seals and bearings from Trelleborg Sealing Solutions are continuously monitored according to strict quality standards from material acquisition through to delivery.

Certification of our production plants in accordance with international standards QS 9000 / ISO 9000 meets the specific requirements for quality control and management of purchasing, production and marketing functions.

Our quality policy is consistently controlled by strict procedures and guidelines which are implemented within all strategic areas of the company.

All testing of materials and products is performed in accordance with accepted test standards and specifications, e.g. random sample testing in accordance with ISO 2859-1:2004-01 AQL 1,0 general inspection level II.

Inspection specifications correspond to standards applicable to individual product groups (e.g. for O-Rings: ISO 3601).

Our sealing materials are produced free of chlorofluorinated hydrocarbons and carcinogenic elements.

The tenth digit of our part number defines the quality characteristics of the part. A hyphen indicates compliance with standard quality criteria outlined in this catalogue. Customer-specific requirements are indicated by a different symbol in this position. Customers who require special quality criteria should contact their local Trelleborg Sealing Solutions sales office for assistance. We have experience in meeting all Customer quality requirements.

## E.2 Storage and shelf live of polymer sealing material

Seals and bearings are often stored for longer time periods. Due to wrong storage conditions the physical properties of elastomers may change during storage. Because of hardening, softening, crack initiation, breakage or other degradation they can become unusable. These types of material deterioration are the result of particular factors or a combination of factors such as deformation, high temperatures, contact with oxygen, ozone, light, humidity or other media.

A few simple precautions can help to extend shelf life of seals considerably. Basic instructions for the storage, cleaning and maintenance of elastomer sealing elements are described in international standards, such as:

DIN 7716 / BS 3F68, ISO 2230 or DIN 9088

These standards provide several recommendations for the storage and the shelf life of elastomers, depending on the type of material.

The following requirements for storage of elastomers and other polymers, based on the recommendations of these standards, need to be followed to preserve the physical and chemical properties of such seals.

### Heat

The storage temperature should preferably be between +5 °C and +25 °C. Direct contact with heat sources such as boilers, radiators or direct sunlight are to be avoided. During storage at low temperatures, elastomers can stiffen. Therefore the handling of seals at low temperatures must be done very carefully in order to avoid deformation or damage.

### Humidity

The relative humidity in the storage area should be below 70 %. Extreme humid or extreme dry conditions are to be avoided. Condensation must not develop.

### Light

Elastomer seals must be protected from light sources during storage. In particular direct sunlight and strong artificial light with an ultraviolet content shall be avoided. The original storage bags, especially plastic bags, are to be favored if they provide UV protection.

In case of strong external light exposure it is recommended to mask the windows of the storage rooms with red or orange covers or screens.

### Radiation

Elastomer seals are to be stored protected from all sources of ionizing radiation likely to cause damage to the stored parts.

### Oxygen and ozone

If possible elastomers should be stored in the original packaging or in airtight containers in order to protect them from circulating air.

Ozone is harmful to many sealing materials. Therefore no equipment producing ozone (i.e. mercury vapor lamps, high voltage electrical equipment, electric motors or other producers of electric sparks or electric discharges) shall be kept in the storage areas. Also combustion emissions and organic vapors should be avoided as they may produce ozone via photochemical processes.

## Deformation

If possible elastomer materials should be stored free from tension, compression or other deformation. Parts delivered in a tension-free condition should remain in their original packaging.

## Contact with liquids and lubricants

Elastomer seals shall not come in contact with solvents, oils, greases or any other media at any time during storage, unless so packed by the manufacturer.

## Contact with metal and non-metals

Direct contact with certain metals such as manganese, iron and particularly copper and its alloys, e.g. brass, are known to have damaging effects on some rubbers. Elastomer seals shall not be stored in contact with such metals.

Because of possible transfer of plasticizers or other ingredients, rubbers shall not be stored in contact with PVC. To avoid a mix-up different rubbers should preferably be stored separately from each other.

## Cleaning

If necessary, cleaning should be carried out using soap and water (demineralized water to avoid lime stains) or denatured alcohol. However water shall not come into contact with fabric reinforced components, polyurethane rubbers or metal components without anti-corrosive protection. Disinfectants or other organic solvents as well as sharp-edged objects shall not be used. The cleaned parts should be dried at room temperature and shall not be placed near heat sources.

## Shelf life and shelf life control

The shelf life of seals depends to a large extend on the polymer type. When stored under the above recommended conditions the below listed shelf life for the different materials can be considered.

NR, SBR	2 years
AU, TFE/P, Thermoplastics	4 years
CR, CSM, ECO, HNBR, IIR, NBR	6 years
ACM, AEM, EPDM	8 years
FKM, FMQ, FVMQ, VMQ	10 years
FFKM, Isolast®	18 years
PTFE	unlimited

Elastomer seals need to be checked after the above periods. If the seals are OK an extension of the shelf life is possible.

Elastomer parts and components with less than 1.5 mm thickness are stronger affected by oxidation degradation even if stored under ideal conditions according to the above described. Therefore they need to be checked and tested more frequently than mentioned above.

## Pre-assembled elastomer parts and seals

Generally it is not recommendable to store elastomer seals in assembled condition. If it is necessary to do so it is recommended that the units should be checked at least every six months. The maximum shelf life period a rubber component is allowed to remain assembled within a stored unit is a total of the initial period stated above and the extension period. The inspection interval will depend on the design and geometry of the unit.

Fluorocarbon Rubber FKM	5
Fluorosilicone Rubber FVMQ	5
Foodstuff contact	115
Form deviations	112
Friction	21, 24, 115, 120, 122, 127

### G

Groove design	3, 25
---------------	-------

### H

Hardness	10, 15-18
Hydrogenated Nitrile Butadiene	6, 9

### I

Initial compression	21
Installation	21, 119-120, 123
Installation recommendations	20
IRHD Hardness	10
Isolast® O-Rings	20, 115

### J

Japanese standard	31
Joule effect	24

### K

KTW	13
-----	----

### L

Lead-in chamfers	20, 25
Lead-inchamfers	7

### M

Materials	13
Military standard	31

### N

Nitrile Butadiene Rubber	6, 8
NSF	14

### O

O-Ring sets	114
Ordering example	31, 119, 121
Oxygen	6-7, 123, 128

### P

Part Number	31, 97, 124
Perfluoro Rubber	5-6, 9
Permeation	116
Polyacrylate Rubber ACM	5-6, 9
Polyurethane AU	5, 122
Polyurethane O-Rings	122-123
PTFE O-Rings	115, 120-121

### Q

Quality Acceptance Criteria	112
Quality criteria	128

### R

Radial installation	23
Recommendations	28
Rectangular groove	27
Rotary service	24
Roto principle	24
Round cord rings	126

## S

Seal Set	114
Shelf life	128
Shore hardness	7, 31, 108
Shrinkage	31, 110
Squeeze	4, 21-22, 25
Standard materials	5, 15
Stick-slip effect	115
Storage	13, 128-129
Stretching	116
Surface finish	26
Surface treatment	127
Swedish treatment	31
Swelling	9

## T

Temperature range	15-18, 116, 120
Tetrafluoroethylene Propylene	5
Tolerance ID	118
Tolerances	7, 21, 110-112, 126
Trade names	5
Trapezoidal groove	27
TSS part numbers	32

## U

UL	14
----	----

## V

VMQ	9
Volume Change	7

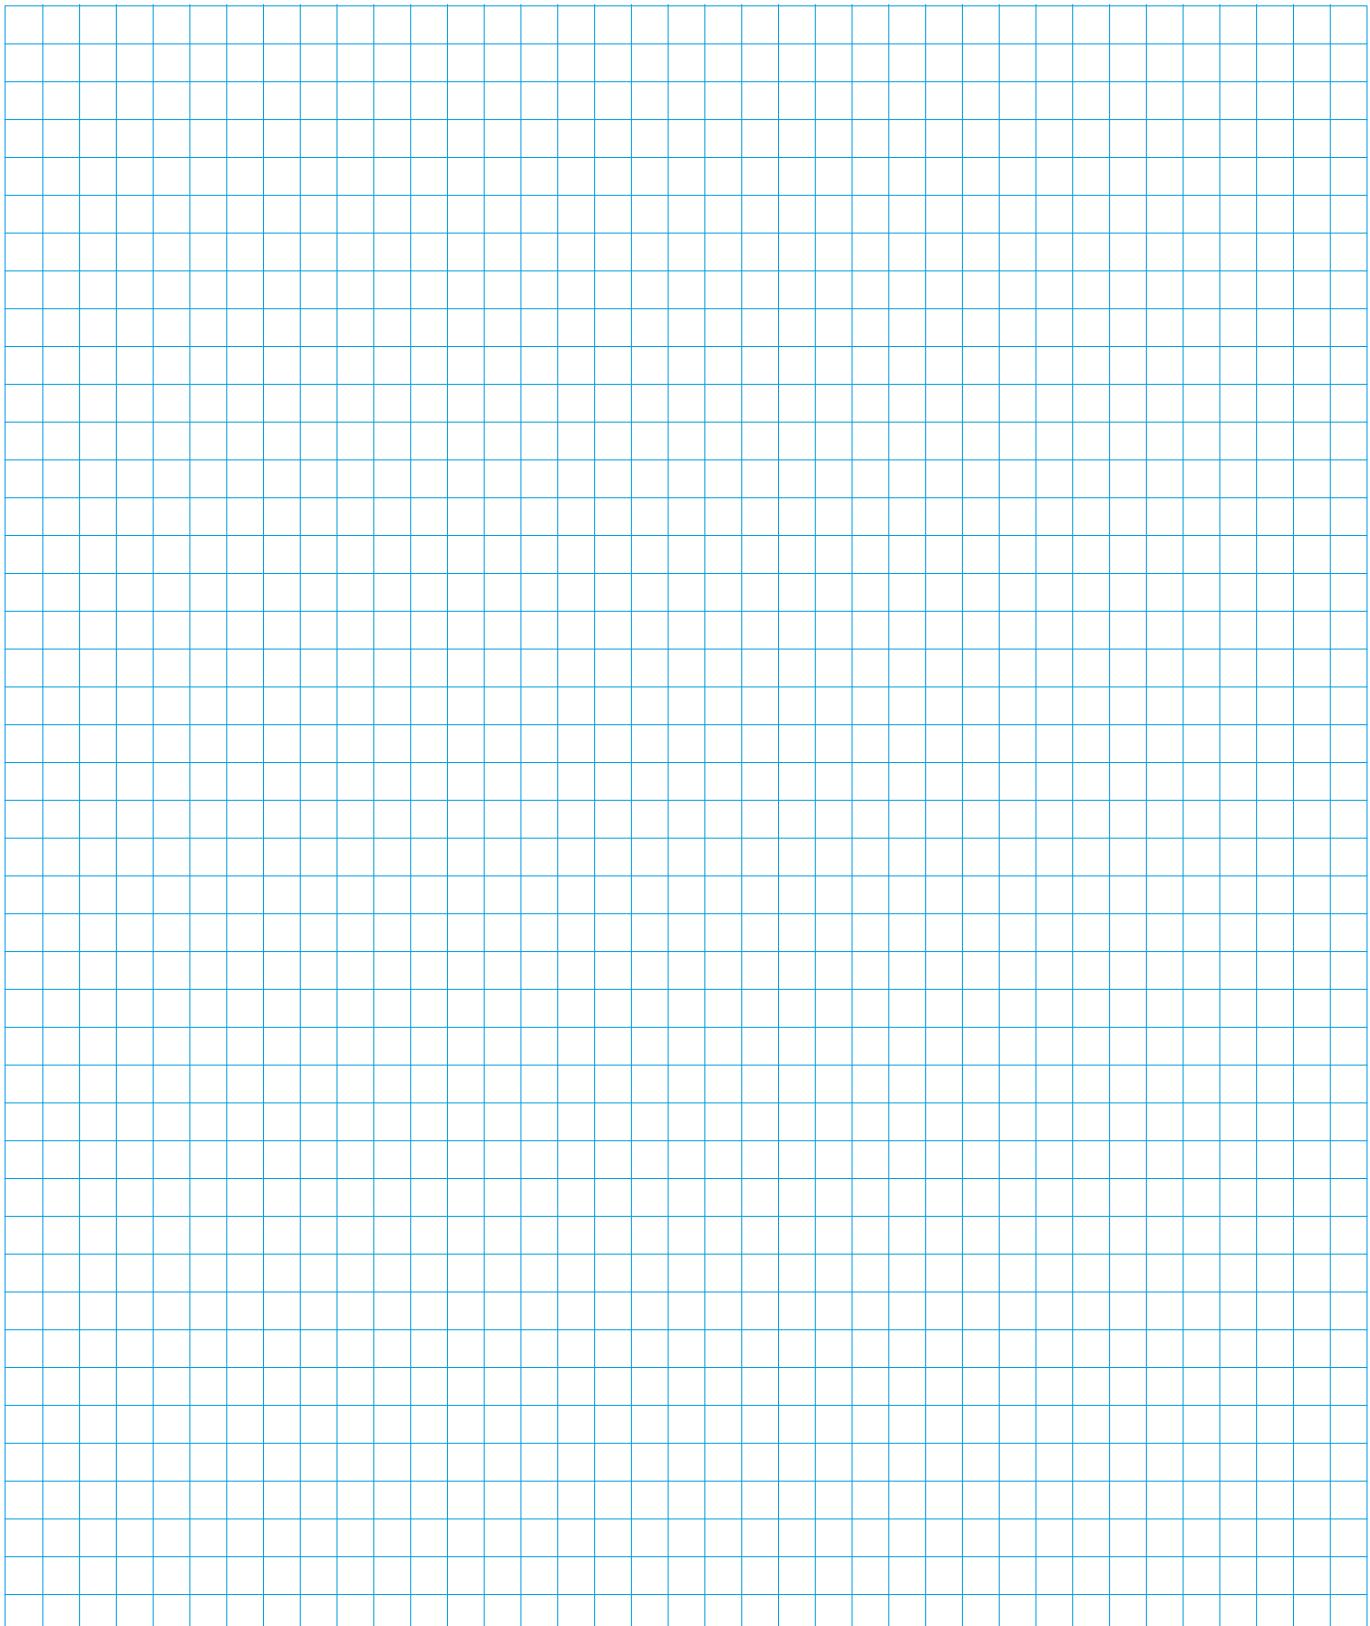

## W

WRAS	14
WRC	14

## O-Ring

### For your Notes
